I knew the Bitstream offerings were commercial, yeah. It was seeing
(and ftp'ing) the ones on a.a.u.e. which threw me. The textfile inside
the archives mentions them being "found" on a PC shareware CD-ROM... The
two I tried were one set of mathematical symbols, and New Century
Schoolbook normal and bold. If someone can confirm for me that these are
commercial, then I'll get rid of them.

I imagine that's exactly what I'll be doing :-) Cheers!

Yep, lots more people shuffling around and peering at stuff as well.. the previous show was a bit dead really....

On a gloomy note, I've yet to go to an Atari show where I've had to queue to get in at all... :)

> I also got to meet all the guys who I've known from the net. Joe
> Connor, Graeme Rutt, and Vic Lennard. I now write some for Vic and ST
> Review, and so it was good to meet these guys.

Probably walked right past me and a large contingent of the Turbonet Posse, Dan. :) If you saw some bloke carrying a large box (containing a desktopper) then it was probably me.

> I got my Key Clicks from them....a 15 minute job, and my keyboard
> feels a lot better.

So it was you, was it? I was going to get myself some and was told the last lot had gone!!

1755. Atari Writer Help

Newsgroup: comp.sys.atari.st
Date: 1994-08-05 19:47:13 UTC
From: mann@austin.wireline.slb.com
Message-ID: <31u501$o1l@maggie.austin.wireline.slb.com>
Source record: 182597

I am trying to help my friend install his new AtariWriter.
He has a 4 Meg STE with TOS 2.06 on it.
When I run the install of Speedo DOos It says that it detected GDOS.
However, he never had GDOS. This is the second install of SpeedoGDOS since I
did not trust his install. Other than that I get no error messages.

When he print s a file the first print works. The second one just locks up the
system. After one print, he is even unable to reinstall the printer without
lockng up.
Questsions:
1. Is his hardware compatible with AW?
2. Any idea what we have to do to get AW working on his system?

Thanks

1758. Huge Atari ST lot for sale

Newsgroup: comp.sys.atari.st
Date: 1994-08-05 20:59:41 UTC
From: jrl8@bonjour.cc.columbia.edu
Message-ID: <31u97t$18i@apakabar.cc.columbia.edu>
Source record: 182579
Cross-posted to: comp.sys.atari.st,ny.forsale,nj.forsale,misc.forsale,misc.forsale.computers.other

I have the following Atari ST equipment for sale. I would like
to sell everything together, but would consider serious offers
to break up the systems.

Atari 1040ST computer system w/mouse (TOS in ROM)
(includes built-in 3.5" drive)
Atari 520ST computer system w/mouse (TOS in ROM), works sometimes

2 Atari SC1224 color monitors
Atari SF314 double sided 3.5" disk drive
Atari SF354 single sided 3.5" disk drive

Supra 30 megabyte fast hard disk with NeoDesk operating system

All power cables, power supplies, and cables are included to
hook up everything.

The following software, all with original disks, boxes, and manuals:
Word Writer 2.0 Timeworks (barely used)
Timeworks Desktop publishing Timeworks (with bound manuals, never used)
Crazy Cars Titus
International Soccer Microdeal
Wizards Crown SSI
Questron II SSI
Heroes of the Lance SSI
SDI Cinemaware Interactive Movie
TetraQuest Microdeal
Prime Time First Row Software
Starglider Rainbird
Starglider II Rainbird
F15 Strike Eagle Microprose
Rings of Zilfin SSI
Speed Buggy Data East
Typhoon Thompson Broderbund
Guild of Thieves Rainbird
Outrun Sega
Captain Blood Mindscape, Inc.
Road Runner Mindscape, Inc.
Road Wars Electronic Arts
Obliterator Psygnosis
Sinbad Cinemaware Interactive Movie
Defender of the Crown Cinemaware Interactive Movie
Pinball Wizard Accolade
Bubble Ghost Accolade
Ultima IV Origin Systems (+ cluebook)

Dungeon Master FTL (no box)
Virus Rainbird (no docs)
Moebius Origin Systems (doesn't work)

The following software has original disks and manuals but no boxes:
Aegis Animator/ST Aegis
Impossible Mission 2 Epyx
ST Basic Atari
Flash Antic Software
Block Out California Dreams
SimCity Maxis
High Roller Mindscape
Time Bandit Michtron
Barbarian Psygnosis
Airball MicroDeal
Airball Construction Set MicroDeal
Skyfox EA
Neochrome Painting Program Atari
UMS Rainbird
ST Wars Miles Computing
Chaos Strikes Back FTL
Swiftar Accustar Software, Inc.

Plus dozens of other games (Rogue, Test Drive, Sundog, etc.) with
just original disks (no box or manuals), plus a TON of shareware
on disks, plus old Atari distribution disks (DB master one, megaroids,
languages, etc), plus an entire collection of START disks representing
about twenty issues.

There are also duplicates of some of the software (Dungeon
Master, Time Bandit, etc).

I am looking for $895 for the entire lot.

Please call or email if interested!

Best regards,
-JRL

Great Atari ST stuff clearance!
(everything with box, manual, etc. in good shape
unless otherwise stated)

GAMES:
For $4/each game:
Deep Space, Obliterator, Terrorpods,
Mr. Heli, Forgotten Worlds.

For $6/game
Wanderer 3-D (shoot-em-up in real 3D)

Compilations (3 or more games per package! what a deal!)
"World Beaters"--Outrun, Gauntlet II, 1943, Street Fighter-- $9
"Triad II"--Menace, Tetris, Baal---------- $9
"Triad III"--Speedball, Blood Money, Rocket Ranger---------- $9

Spectre 128/GCR System software:
(just original disks, no manual)

Spectre 128/GCR software, version 2.65.....$5
(quite stable version, supports only the Atari ST mono monitor)

Spectre 128/GCR software, version 2.65c.....$8
(sounds do sound ok, supports both the Atari ST color & mono monitor)

Printer:
Atari SMM 804 (parallel printer).....$35
(the plastic cover is cracked, but the printer is still in
working conditions...I even throw in a couple brand-new
ribbons!)...no manual, no "original" box.

buyer pays shipping
Prices in US dollars

Interested? please e-mail me! :)

I don't like self-extracting archives either. Some extract to
the same directory as the archive. Some extract to a subdirectory. You
can't predict and it becomes a hassle. With ZIP, on the other hand, you
can use STZip and extract it to wherever you want.

I wouldn't recommend it with LZH, though. The latest version (and
before) or LHArc doesn't work right when installed as an application. If
you double-click on an archive that has garbage at the end (from
X-modem), it just locks up.

Why would you ask a question like this in the Atari group? ;-)

The important signals are: 8-vsync, 9-hsync, 10-video, 13..19-GND.
It expects to see an 1120x870 signal at 68.3 Hz. I have no idea
if/how well it would handle Falcon sync rates. But there are worse
problems. See below.

> I was wondering if I could get the nice-looking monitor to work with my
> Falcon. It is basically a four-color monitor (greyscale). WILL IT WORK?
> And if so, would it work with like ScreenBlaster or something so I could
> get some decent resolutions on it? Any info appreciated.

Yes, it's a grayscale (analog). But don't forget that the display was
designed as an integrated unit for the NeXT boxes, and draws all its
power from them! I.e., there's no AC power cord. You need to supply
+/- 12volts on pins 1&2 (respectively) and 11&12 as well. And I'd ex-
pect at a pretty sizable amperage too.

Unless you feel like building your own power supply to drive it, I'd
guess not. Did you ask because you have a source of cheap NeXT tubes?

- Mark

P.S. It's only 4-level grayscale because that's what the NeXT gen-
erated. If you do manage to hang it off the Falcon, you could do
256-level grayscale on it.

1765. Shareware headache

Newsgroup: comp.sys.atari.st
Date: 1994-08-06 03:29:14 UTC
From: Matt.McAlister@dataport.com
Message-ID: <f5b_9408051942@dataport.com>
Source record: 182620

I am sick and tired of downloading what looks like it would be a good program only to find out that the author is with-holding the majority of the program until you send him so money. Now I know people would like to earn some money, and there are some damn good programs out there, but what's wrong with giving a bare-bones version of what they're working on.

I'll give you an example: After searching for what seamed like an eterenity for some virus protection for my hard drive I finaly found a program called SVK-pro or something like this. So after I extracted it I found out that the libraries of virus protect progs were being held up until you register. I felt like I was being held up!!!

Another example, I downloaded ST-QWK only to find it wont work at all until you register. To me this is like going to test drive a car and having the salesman show the ashtray and then say "you can see the rest of the car when you buy it"

How rediculous!!! C'mon people last time I checked sharing was a selfless, generous act. A gift from the heart not the wallet. I know I'm going to get a lot of flack from shareware authors, but that's how I feel.

I'm not remotely predicting, but what could make a lot of sense would be machines based around marginal-spec DEC Alpha chips and an innovative OS like maybe Hurd. Very graphical. DEC has to have a lot of chips that don't quite run up to speed, and they don't have the resources to launch a really personal product line while salvaging the rest of the company. The Tramiels clearly love running a computer company, even if they aren't very good at it. Alpha chips are fast and flexible. Modular operating systems offer a very decent shot at low overhead and limitless flexibility (remains to be demonstrated, of course). It'd be fun, anyway. And of course, since the 68000 series is a PDP semi-ripoff, it would be fitting to move on to the successor of VAX.

As far as I know there will be an update on NVDI very soon that'll feature
a built-in NVDI vector-font-scaler. _THAT_ will really give you killer
performance. So why spend money on a single SpeedoGDOS when you can get
a real NVDI that includes a vector-font-scaler, which will blast all
external GDOSes to hell?

Granted, there's a certain amount of seeming absurdity involved. There's exchange rates to contend with, bank fees on international money orders, postal fees ... it all adds up in the end. But then it's little different than mail-order shopping; you've most or all of the same contentions to deal with, and they are often more costly if you're ordering hardwre, since then you have to pay shipping by weight. Far more costly than simply slipping an envelope with a two ounce money order into a post box.
An unfair comparison, I suppose, but it relates after a fashion.
Still, though, such irritants serve to deter people from registering foriegn Shareware due to the inherent nuisance that's involved in doing so.
Unfortunately, there's less than nothing we can do about it.

And when it gets right down to it, it's relatively fair ... in its own capitalist sort of way. :-)

> where you told how many, or should i say less, people who have registred.
> Maybe it's not such a bad need after all).

I figure there are a number of factors contributing to the distinct lack of registrations. The first, is that some may be waiting for a future version that will import ASCII and raw ANSI files, or whatever feature it is they so desperately withhold payment for. (In practise this is still somewhat dishonest, since using the program regardless of future intentions or anticipations still necessitates registering) The second is that perhaps they're lazy, or maybe can't quite afford it. The third, as always, is piracy, and I do have it on good authority that it has been pirated. (At least, this is what I have been told at the moment; the details seem suspect, but if the source is accurate it has)

I can't really gripe about any of these points -- no, not even Piracy. I, in fact, fully expected my program to get pirated when I released it. What I thought would be a hod commodity, the first of its kind ever to be made, I would think it would get pirated with quick dispatch. I'm not sure whether to be pleased at the fact that I was right or not...

1774. CR and line feed stripping

Newsgroup: comp.sys.atari.st
Date: 1994-08-06 10:35:09 UTC
From: kfason@csn.org
Message-ID: <Cu402L.4xo@csn.org>
Source record: 182564

Anyone know of a simple program that will strip the CR and or Line feeds (Whatever the atari uses, I think both) from ASCII files? Except of course at paragraphs?

Reason being I import quite a bit of ASCII files into Atari Works and it doesnt do it (has a strip for export though)..

thanx!

What is the newest version of PFXPAK.TTP

Is it much better than version 1.1 ?
Does it pack better ?
Does it depack faster at run-time ?

Could someone uuencode and mail it to me ?
(great reward to the first one :-)

No, I don't see any good solution either. My best solution is to find alot
of people who wants to registre the same software as i do, but living in
a country with around 1000-3000 active atari users, (and only two dealers)
it can be pretty hard job.

Let me ask you a question. How many do you think pirate your program ? And why do you think they did, if they did ?

Another question. Is this release of FANSI a demo version or a shareware version, (sorry i ask this, i could just have read the doc's, but i want to hear your answer). In my opinion there's a big difference between a demo version and a shareware version. If people thinks it's a demo version, they also think there's no need of registre, (cause thats what demo is all about). And those who do believe this, also lives with the limit in it. (and thats not piracy). On the other hand, if it's released as a shareware version, they have to registre when using it. But why is there limits then ?
Shareware means, you pay for what you see when testing it.

1777. High(ish) Speed Modem Help =)

Newsgroup: comp.sys.atari.st
Date: 1994-08-06 12:38:51 UTC
From: P.A.Booth@bradford.ac.uk
Message-ID: <1994Aug6.123851.26543@bradford.ac.uk>
Source record: 182569

I'm thinking of upgrading to a faster modem, (around a 14.4k one), and have seen some techo jargon flying about that I'm not quite sure of.

1) What's the difference between a Rocwell chipset in supras and the us robotics chipset?

2) If the line get's a bit 'flaky' I heard that the usr modems drop automatically to a lower speed but others don't, is this true?

3) What's the difference between hardware and software implementations of the error correction and compression techniques?

Thanks for the help.

Paul.

I suggested paper mail for two basic reasons. 1. You are concerned of the
cost of calling one of his support BBS systems. 2. Electronic mail has,
so far, not gotten you a response.

I really don't think developers put intentional limitations into their
commercial software. Do you know of something like that ever happening?

> this friend around all day looking over his/her shoulder all the time, or can
> it?

Actually it does. It falls under a general "bourden of responsibility" as the person who purchased/licensed the software. It's an extension of the same legal principle that makes it illegal to receive a stolen item, even if you had no idea it was stolen.

I'm not defending this principle, just explaining it. However, the truth is that just about everyone who we have caught pirating our software uses that as an excuse. "My friend/someone at the user group/etc. must have made a copy when I wasn't looking." You have to draw the line somewhere.

We make it very simple in our software. We place the burden of preventing the copy you got from being pirated on you. This might be considered harsh, but I haven't found a better way to handle this problem (I'm VERY open to ideas, though).

Honestly,

Pure C already supports MultiTOS, AES 4.x, Geneva, you name it. We write everything in it. More recently, we wrote Geneva and now NeoDesk 4 in it.

> If so will Gribnif be importing it?

We currently do. ASH (the creator) is very eager to get us to sell as many as possible, so they are talking about an upgrade "real soon now", but nothing yet.

> If so what will the upgrade policy be?

No idea. They haven't given us any pricing info yet. They probably don't know themselves.

Can someone give me any information about this program (multi.zip on
a.a.u.e.)? I downloaded it and can't seem to get it to run, even on
a totally bare system (TOS 1.62, 2 meg STe, 48M hard disk).
Nothing at all happens...I just call it, and a half second later I'm back
to the desktop as if I'd never left it.

I wouldn't normally worry about it, but it was a 790K download at
1200 baud and I'd like to at least get a few bombs for my trouble...

Thanks,
Victor Bruhn

1788. ZFC Cover Globe in WWW Based Atari Directory

Newsgroup: comp.sys.atari.st
Date: 1994-08-06 15:48:43 UTC
From: groenink@inter.NL.net
Message-ID: <Cu4EL7.A8n@inter.NL.net>
Source record: 182572

ANNOUNCEMENT

ZFC have set up a set of WWW pages, available from your WWW browser (such as Xmosaic) at the following address:

http://www.nl.net/~zfc/index.html

These provide general information about ZFC, the Edith Professional Text Editress package, digressions on the history and future of text editing applications, but in first place we offer

ZFC's Atari Directory

providing access to almost any Atari information and software available on the Internet, such as FTP, Usenet News, Frequently Asked questions and other information on the World Wide Web.

UNDER CONSTRUCTION

The pages are still under construction. We apologize for any inconvenience. Some references point to non-existing files. These mainly provide business information, which we are happy to supply by electronic mail. You can send e-mail to us directly from your WWW browser.

COMMENTS and SERVICES

Any comments, suggestions or contributions are welcome. We plan to include a list (the 'Atari Grey Pages') of Atari addresses soon. Information as to how to include your address in this list can be requested by electronic mail. Several services, such as automated e-mail forms will hopefully be among the possibilities.

ACKNOWLEDGEMENTS

People who have replied to our previous call for contributions---thank you very much. If you provide a WWW service and have mentioned it to us, please check that our references to your pages are to your full satisfaction. If not, please notify us by electronic mail.

Well, that would explain why it won't run. :-) I suspected such, but
it was in the regular Games directory and the index listing didn't
mention this. Perhaps the original uploader didn't tell the archive folks.

>BTW, how long did it take to D/L at 1200 baud?

Just under two hours...

Well, as long as the NVDI supports Speedo, TrueType fonts then I'll buy it
(no, I'm not being sarcastic) until then I'll keep my SpeedoGDOS.

1792. Re: The future of Atari Computers

Newsgroup: comp.sys.atari.st
Date: 1994-08-06 18:21:13 UTC
From: eli@ripco.com
Message-ID: <Cu4LnD.9w1@rci.ripco.com>
Source record: 182577

: 3. The market(s) they should aim for:
: a. people who want to get a computer but don't want to spend $1000.
: b. Present atari loyalist
: c. People who want to get they kids a computer but don't want to
: spend $1000 for a toy
: 4. The system: 68k based, compact case, rfmodulator and rgb, 3.5 floppy,
: cdrom. It should be ST TOS compatible and atlest run JAG cds. The cost
: should be under $500.

I have a slightly diffrent idea, sort of like this. I think that
Atari, or any other company with an real R&D division and not all that much of
a reputation for doing X or Y should come up with an "internet nintendo". If
the number of people with some sort of access to internet is to increase from
10% to close to 100% of the US population over the next 10 or so years, the
someone is going to have to come up with a system that makes it possible.
People without a lot of money who work in jobs for which they realy don't need
a computer (these same people, in many cases, own game systems already) are
going to need something to "plug in" to internet. What about a machine like
this:

1. Hooks up to your TV set, very easy to setup.
+2. Smallish built in mass storage device (20mg HD or, in the future a Flash
E-PROM bank and either a 3.5inch floppy drive or a cartrige slot.
3. Modular design, like the ill-fated TI-99/4a or (to a lesser extent) to
C= 64 and Atari 8-bits. One mod. would transform the base unit into a
full fleged DOS machine or Mac. Others would add options like extra floppy
drives.
4. Relitivly fast built in modem.
5. Keyboard and pointing device
6. Easy to use graphical interface and internet software built in.
7. Full set of ports avalible. Par. and Serial would be built in and SCUSI
and MIDI avalible on higher end versions or as options.
8. Total price of $100.00 or less, idealy about $50.00
9. Sort of portable size/weight (i.e. about the size of a game system).

This may not be much of a fantasy. The price for all the parts at retail
is about $300.00 with the cheapest parts in Computer Shopper. I'd
figure that if you could find small enough hardrive and buy the parts in
bulk, the price (without actualy building any parts yourself) could go down to
about $200.00. Even then your paying for a lot of stuff that you may not
need.
TOS _could_ fit into this picture as the front end operating system for all this.
From the little of it I have seen (I don't own an Atari), it gives reasonable
performance of slow chips with little memory like a i386SX/25 or a 68000.
However, a modified version of PC-GEOS, a minimal version of Windows or even

Tandy's old Desk-Mate might be best.

Source record: 182587

Well, it turns out I not only have to be a developer ($100), but I also have to pay an extra fee ($100) to get DSP JPEG information. This means I need at least 8 people who would register if I added DSP JPEG support to justify the cost. Darn. I might as well get Devpac DSP and code one myself. Probably would be faster anyway, given my record. =) If I don't get more registered users, I just can't afford to add Brainstorm DSP support, sorry.

I totally agree.. No matter what hour I try, I get "All connections are
busy".. Uimich is the ONLY atari source I know, for files...
Does anyone know any other ones, could you give me the addresse(s)?

Or, maybe someone knows of any way to access Uimich other than the obvious
way...

Hi,

I am curious why the mirror for atari.archive.umich.edu at wustl hasn't been updated since late June? I go to wustl's /systems/atari/umich.edu/... and see nothing new there (wustl no longer keeps "/mirrorX" directories, it's all under "/systems").

Since the umich site is *always* busy any more, even during late nights like at 11:pm CDT and early mornings like at 4:am during its archiving, I cannot get a FTP session going at all at any time! This whole Atari market seems to be dwindling to boot. It'd be really nice to have a secondary archive site available that is reasonably up-to-date, and I thought wustl was such a place?

The umich site continues to put out weekly "new uploads" listings to the newsgroup, but it's useless if we can't get on & partake of things, ya know? (And I've yet to figure out why Hensa has to make their filing system so complex!)

Really? I've been using Works for a while on a 4MB STe with /tons/
of TSR/DAs installed, driving a Panasonic KXP1123 at 360x360dpi without
any problems. What's supposed to happen?

> There have been plenty of Demo versions on some of the UK mags, like
> Protext 6 and Calligrapher...

And Calligrapher is sadly not supported any more by Working Title. I
don't know if anyone has bought the rights (does anyone have an idea?).
When I reviewed Calligrapher Pro for ST Format, Working Title decided to
drop support 3 days before the review was on the streets... Gah! :-)

> I have been reading themessages regarding Atari Works on GEnie, a lot
> of people think it stinks, even parts of the manual is upside down..

Wow... I know Works is a bit quirky, but honestly, I've had no
problems with it /so far/ :-) Now I've said it... <g>

Mike -

SpeedoGDOS 5 does not support Calamus (.CFN) fonts.

Laurenz Pruessner (spoil@cs.tu-berlin.de) wrote:

: As far as I know there will be an update on NVDI very soon that'll feature
: a built-in NVDI vector-font-scaler. _THAT_ will really give you killer
: performance. So why spend money on a single SpeedoGDOS when you can get
: a real NVDI that includes a vector-font-scaler, which will blast all
: external GDOSes to hell?

Because SpeedoGDOS 5 supports more font formats than NVDI. The standard format for most professionals is still Type 1 (and arguably with good reason). SpeedoGDOS 5 supports Type 1s, NVDI does not.

You do not need to set up scripts for Zmodem with Connect. You just need
to select Zmodem. I never had to setup anything special on Connect. Most
good programs are unusable on anything less than ST high.

Is it WISIWYG?

> As for comparing NVDI 3 and SpeedoGDOS 5, NO ONE has used both yet

I have. I am beta tester of NVDI 3, and I just got one of the Speedo 5 that
were sold at this UK show. So let's talk numbers.

This is a speed comparison of Speedo 4.2, Speedo 5 beta 30.7.94 (sic!
that's what the boot message says) and NVDI 3 beta 6.8.94.

All tests are taken on a TT 4+4 on a big mono screen with MagiC 2.0. For
for Speedo 5 I had to use TOS 3.06 since it kept reporting internal scaler
errors and crashing in MagiC (same with MultiTOS, BTW)

There are two things that affect performance:
1) output of already cached characters to the screen
2) rendering, creating bitmaps for the cache from the vector information

For 1) I leafed through a 38 page document with mostly Swiss 10 pts, making
sure that all characters were already in the cache before starting. Times
were stopped with a chronometer.

NVDI 2.5 + NVDI 2.5 +
Speedo 4.2 Speedo 5 NVDI 3 (papyrus' own caching)
33 sec 33 sec 21 sec (16 sec)

Sven Behne says he hasn't built in the really fast routines yet because of
multitasking considerations. I can post new results when it's ready.

For 2) I leafed through a four page document where each page contained 18
different text samples from 3 to 96 pts, using the variations normal, bold,
italic, bold&italic of Swiss 721 on the four pages, making sure that no
characters are initially cached except those of the first visible page.
Thus all characters have to be rendered.

NVDI 2.5 + NVDI 2.5 +
Speedo 4.2 Speedo 5 NVDI 3
15 sec 15 sec 8 sec

The same test with the TrueType font "Venetian":

NVDI 2.5 + NVDI 2.5 +
Speedo 4.2 Speedo 5 NVDI 3

- 1 min 4 sec (!) 15 sec

I don't have any Postscript types for testing, but someone who tried
it told me they are even slower than TrueTypes.

I did not notice any text quality differences.

> SpeedoGDOS 5 has new output routines, and will actually work with
> NVDI if it's installed, throughput is up to 600% faster than SpeedoGDOS
4.x.

Strange that I didn't notice anything of that... Or maybe these 600% are
for the "set squiggling level" call ;-)

> We asked ourselves, how would
> one get the the best system/performance, and the answer is with
> SpeedoGDOS 5 and NVDI (any version) together.

Wilfried Behne says there is no conceivable way how Speedo could "work
with" NVDI, except by using the standard copy raster calls etc. But this
does not significantly affect the performance of text output.

The Behne brothers say NVDI 3 will be finished in about two weeks.

> SpeedoGDOS 5 sets a new
> standard for type scalers (in supporting all major font formats and
> killer performance) and by using NVDI for some display routines, you get
> capabilities and performance that outstrip one or the other alone.

My estimate is that NVDI 3 will be the standard, since
- many people already have one and only have to upgrade
- former versions are known as extremely reliable and compatible, whereas
this is not exactly true for former Speedo versions
- NVDI 3 is much faster

Nothing at all would be wrong with that, if people were honest...but they aren't, so some incentive to register has to be given if any income is to be hoped for. You'd be surprised at how much thought can go into what sort of limitations to put into a demo; some schemes are good, some may not be. But I have been in on several such decisions (one of them for my own program), and the line between showing users that this is a good(?) program and just giving them the entire thing is a very fine one in many cases, and I certainly wouldn't want to try to figure out how to do it with a virus checker.

```

There are also UVK (Ultimate Virus Killer), which does link & boot-sector viruses. This is the most complete virus killer available, I can't remember the cost off-hand.

And, Antidote which handles link viruses and boot-sector viruses. It is also very GEM compatible (Works with Geneva, Multi-TOS, etc.), it's detection routines are also over 1000% faster than UVK's. (It's _extremely_ swift!) It also scans the cookie jar, and lets you examine various memory-hooks.... This is shareware...

>Phone numbers and addresses would be most appreciated.

You can find some stuff on the ftp-server hilbert.maths.utas.edu.au in the
directory pub/astrology/Software/Atari. These programs are not the best
available they are just Shareware/Freeware.
If you are a skilled C-programmer you can also try to translate Walter's
C-sources for Astrolog for the Atari.
If you want to have really good programs you have to spend some money on
German software. Good and available programs are:

HORCOM 3B
TNP
ASTROGRAF 3.0
ASTROPRO 1.5
ASTROGEOGRAPH 2.3 (Astrocartography)

email me for detailed information.

That's a smart way ... perhaps a bit time consuming and possibly difficult, but it certainly saves the money, I think. And anyway, if worse comes to worst you can always send straight cash ... at least, I'd accept it -- though it's risky, converting German marks (or whatever I'm sent) is simply a matter of walking into the bank and doing so. Or at the very least a currency exchange store.

As for a place ith 1000-3000 active Atari users and only two dealers -- I'd say that's about the same situation here in Toronto. Three or four active dealers, though ... still, it's still quite a pain.

> I think that depence on which side you look at 8-)

Hmm. Okay, it certainly DOES look better from the seller's point of view than the buyer. :-)

> Let me ask you a question. How many do you think pirate your program ? And
> why do you think they did, if they did ?

I couldn't even begin to guess how many people pirate my program. If I had to take a wild stab in the dark I'd have to probably say that for every legitamate user, there are probably 100 pirated copies in use. Of course, that's a wild little estimation, but it's as good as any, I suppose, since I really have no idea. As to why they do ... who knows? Something for nothing, I would guess. All the functionality with none of the cost. Maybe they feel that they're getting away with something. Some may have used a pirated copy with the idea in mind that they are going to register it -- or got the pirated version so that they can give it an evaluation (though the shareware unregistered version does that just fine) before deciding whether or not to shell out. It still doesn't make it right, but it's nothing I can stop or do anything about. Not and hope to make any sort of significant progress.
In my case, I would rule out "too expensive", as seems to be the standard fallback explaination for why someone pirates. I wouldn't call $15 at all costly.

> Another question. Is this release of FANSI a demo version or a shareware

> they have to registre when using it. But why is there limits then ?
> Shareware means, you pay for what you see when testing it.

Not necessarily. I put the restrictions in there as a means of encouraging
people to register. I have often found that if one writes a program and
then releases it with absolutely no restrictions, there is no incentive or
sense of urgency towards registering. People get lazy and eventually don't
register because there is no incentive to do so; there is nothing it in for
them, as it were. I know I"ve been guilty of that in the past. I figure,
if I restrict some of the features, perhaps it will give them some incentive
to register. If they register, they get more. I look upon it as no
different to those who offer their program, and if people register, they'll
get more software written by that author. The Fansi version 1.00/1.01 that
is out right now is a Shareware version. ANd if you register, you get te
incentive of more functions at your disposal. It is not a demo or freeware.

You may have heard that Supras have problems with this and it was certainly true in the 'early' days but the latest ROM versions are fine - well mine re-negotiates quite happily when the situation arises. (a SupraFax v.32bis)

: of hashing all the names to atari and fixing up the makefiles.)

: Is there anyone out there who has a working version of Linux (kernel) or at
: least the sources (ready to compile) for the Atari TT?

Atari Linux is slowly syncing with Amiga-Linux.
The last version of the Linux-68k has some of the Atari patches
in it but not all that are needed and some are out of date.

Version 0.9pl2 will (hopefully) have all the patches needed and allow
you to build either an Amiga or an Atari kernal with one
comandline parameter (Am I dreaming?)

There are still lots of problems with different TT-boards and
SCSI.

Linux will not run on an Atari ST[a-z] but there is someone
who will work on a PAK-support (Prozessor Austauschkarte with 68020/030).

I'm not sure if you will be able to compile Linux with TOS.
You will need a decent Unix system (maybe MiNT will be sufficient)

There are some versions of precompiled kernals around and there
are ramdisks that hold the /bin tree in memory. But most
people are lucky to see the prompt and are far from working
versions of Linux.

: I'm thinking of upgrading to a faster modem, (around a 14.4k one), and have
: seen some techo jargon flying about that I'm not quite sure of.

: 1) What's the difference between a Rocwell chipset in supras and the us
: robotics chipset?
The Rocwell chipset is the V32.bis (note the 'bis', V32 is NOT V32.bis)
protocol used in all of the low cost 14.4 modems (not US Robotics or
Hayes) and was a cheap cost way to provide a 14,400 baud protocol for the
masses. US Robotics developed the HST protocol and it's just a different
protocol to do 14,400 baud. They are NOT compatible, so most every
manufacturer uses V32.bis and even US Robotics made a modem called
the Dual Standard (both HST and V32.bis, thus the name 'Dual').

: 2) If the line get's a bit 'flaky' I heard that the usr modems drop
: automatically to a lower speed but others don't, is this true?
No, most if not all modems will drop speed on flaky lines, but the
US Robotics modems have Asychronus Leveling (ASL) which will bring back UP
the speed of the modem if the line becomes clearer. This is great because
often when you connect you get some flakyness and modems will drop speed
immediately, but the HST's will come back up soon after.

: 3) What's the difference between hardware and software implementations
: of the error correction and compression techniques?
The hardware ones are faster and are so sophisticated now that you really
don't need software error correction (V42.bis is very good error
correction hardware), the hardware in 9600 and up modems usually has
compression hardware too, this way it takes almost no time compressing as
it transmits (try sending a text file, it will FLY over at double or
triple the normal 14,400 speed).
Software error correction is very primitive, but usefull, XON/XOFF is
simply Cntl-Q and Cntrl-S commands sent when transmitting to pause the
transfer of information because too much is being sent at once. RTS/CTS
is the same thing but are actual modem signals, thus an electrical line
gets turned on or off to signal information to stop or go, this is faster
and more efficient.

Are we talking about a Hard Disk Virus or a Floppy one, you don't need
a Virus killer for floppy Viruses, most programs can check if a floppy
has a bootable boot sector, if it has just change the first byte of the boot
sector to 00, then you can restore it if it was a valid boot sector..

If it was the Hard Disks boot sector, then the Hard Disk would never ever
boot....

A Disk boot sector is only active if the disk is booted, not buy running
any programs on it...

So why all these rave about Viruses, the only one that could be a problem
is the so called Link Viruses...??

All this talk about Papyrus, does it have a full English Dic and Thesaurus,
the English version that I brought of Script never had a English Dic,
only USA one, the usual problem with German software...

I read a review of Papyrus in ST-Review March 94, there was no mention
of a Dictionary or Thesaurus, or what resolutions it supports or
the memory requirements...

The problem is we are still lacking in a good ENGLISH Word Processer/Doc
Processer that can work in Med resolution, and with full Dic/Thesaurus
and Font support....

I spoke with Atari a few days ago. There are a bunch of Lynx games on the back burner right now (Eye of the Beholder, Geoduel, Cyberdrome?, AvP, Super Missle Command/Asteroids, Raiden...) After the major Jaguar release, Atari is going to release these games and start pushing the Lynx again. One thing at a time I guess. So, no, the Lynx isn't dead, but since many people are giving up on it, it's a great time to pick up lots of games. Our local Atari dealer, Neutronics, has most Lynx games for $15-20 since his distributor want's to unload them. Now I have 25 games ;)

1830. Virus Protector

Newsgroup: comp.sys.atari.st
Date: 1994-08-07 14:14:39 UTC
From: larserik@oslonett.no
Message-ID: <322q8f$8ol@hasle.oslonett.no>
Source record: 182622

People have been asking for a small virus protector that
can discover both boor- and link-viruses...

I have made such a program and if anyone wants it I'll
uuencode and email it (just sende me a message).

Here is a copy of the READ.ME file for PROTECT6. It also tells
you about viruses, how they work, and how to get rid of them:

Protect6 - Your way of protecting your system against viruses
""

Protect6 is a small but powerful program that is resident in RAM
looking for bootsector and link-viruses. It's easy to install
(just put it in the AUTO-folder on your boot disk) and easy to use.
Before you install it you should read this documentation and learn
to know the different messages, warning and questions you might get.
The program is tested, but you are using it at your own risk anyway.

Bootsector-viruses
""""""""""""""""""

Each time the system detect a new disk in drive A: Protect6 will
check this disk to see if it contains a bootsector-virus.

If the disk is allready immunized or if it is a MS-DOS disk you
won't notice anything, BUT if the disk IS auto-booting you will
get this message in the upper left corner of the screen:

Disk is Auto-Booting, Should I kill it ?
<here is the contents of the bootsector>
Call ABK-BBS +47 67132659, 300-14400 BPS

In the middle line the contents of the bootsector will scroll
by giving you a chance to decide if it's a virus or another
type of auto-boot (it could be an auto-starting game etc...)

If you decide to KILL and IMMUNIZE the disk press Y for YES,
if you DON'T want to CHANGE the bootsector press N for NO.

If you decided to kill the disk or if Protect6 find a disk that
is not auto-booting, but isn't immunized either, it will try to
immunize the disk and you will see this message on the screen:

Killing and Protecting disk in drive A:

If everything went well the message will dissappear and the screen
will be redrawn and control returned to the active program/desktop.

If the disk in A: is write-protected you will get this message:

Disk is Write-Protected, Try once more ?

If you still want to KILL and IMMUNIZE the disk you should REMOVE
the WRITE-PROTECT tab and press Y for YES, if you have changed your
mind and want to KEEP the DISK as it is just press N for NO.

All disks immunized by Protect6 are auto-booting and readable on
MS-DOS and PC-DOS systemes (IBM's) and contain an info-text.

Link-viruses
""""""""""""
This is a very nasty kind of virus that contaminates program files
and spreads like fire on harddisks. Protect6 hooks on to the OS-
routines and gives an alert if a program tries to modify another
program (this is the way all known link-viruses spread):

Program is trying to modify FILENAME.PRG
Any key to modify file, Reset to Abort !
Call ABK-BBS +47 67132659, 300-14400 BPS

FILENAME.PRG is replaced by the name of the program that will be
modified. If this is OK just press ANY KEY (some programs store
their configuration data this way), BUT if the program currently
running is NOT supposed to MODIFY the indicated file you should
write down the name of the program running and press RESET.

When the system has rebooted you should examine and if possible
remove the program that tried to modify another program. If you
have an older (hopefully non-contaminated) backup you should copy
this on to the disk and see if the problem dissappear.

Problems
""""""""
If you get any kind of problem with viruses or have any questions
about Protect6 or about viruses don't wait - Please contact me:

: Because SpeedoGDOS 5 supports more font formats than NVDI. The standard
: format for most professionals is still Type 1 (and arguably with good
: reason). SpeedoGDOS 5 supports Type 1s, NVDI does not.

Well, I doubbt if there are many "professionals" out there who still use
an Atari for their job. But if there are, SpeedoGDOS will sell quite
well.

I think that there are way more people out there who don't care a damn
shit about what you regard as a "standard" but will need an access to
cheap vector fonts. And that's exactly what NVDI provides.

What I've seen of SpeedoGOD 5.0 (and I haven't seen that much of it) was
a hack, that did run into enormous trouble as soon as it came to using
GEM text attributes. It furthermore crashed the scaler as soon as I used
Mac- or some PC-encrypted fonts and was helplessly slow. But, you're right,
it feature more font formats as NVDI. I, for my personal point of view
don't want to wait until COMPO decides fo fix their bugs as long as I
can use NVDI, which does not have these problems.

NVDI therefore was much faster than SpeedoGDOS 5.0, did not show the above
mentioned incompatiblities, did not crash and was cheap.

But, anyway, let the people buy whatever they think they need...

Absolutely, positively do *NOT* get a ZOOM. Checkout the modem
information at http://www.whnet.com/wolfgang/ or read the *.dcom.modem
groups. I have a ZOOM VFX that I don't use anymore on account that it
can't connect to a whole bunch of modems and likes to drop carrier. I
ordered an AT&T Dataport from Sparco (send mail with subject: sfind
help to mailserv@sparco.com).

How much is cheap?

I suspect that SpeedGDOS left the door wide open for NVDI to charge too
much for the upgrade. I paid $57 including shipping for the 4.0 to 5.0
upgrade. (I wonder when I'll get it...)

My guess is that NVDI will be a little less but still high.

ATARI ST Computer System For Sale

Atari 1040 STf Computer System with the following features:

- 1040 STf with 4 MB Memory, TOS 1.4

- Color and Monochrome Monitors (New Style Mono Monitor)

- ICD Fast 50 Hard Drive with Second Internal Hard Drive (Quantum ELS85)

- Spectre GCR Mac Emulator with Mac ROMS

- Supra 2400 Modem

- Mouse Master

- 2 Joysticks - EPYX and KRAFT StarMaster

- Software:

- Laser C with Laser DB

- Assempro ST

- NeoDesk

- Sozobon C (incl Source Code)

- TOS 1.0 and 1.4 on Disk

- ST Talk

- PaintPro

- TextPro with ElectraSpell ST

- EPYX Winter Games

- Books:

- All original Atari Manuals

- Atari ST Internals

- Atari ST GEM Programmers Reference

- Atari ST Machine Language

- Atari ST Peeks and Pokes

- ST Disk Drives: Inside and Out

- START Magazine: Mar 90-May 91

- MacUser Magazine: Jul 91-Apr 93

Asking $700 US. Would like to sell entire system as a package, but will consider offers on separate pieces. Please respond via email or contact Russell at (613) 831-8475.

hat with Todd, I have both a Zoom 14.4 and a USR
Courier Dual HST modem....When I first got my zoom I did have problems,
but they sent me an upgrade chips set and once I learned how to config
it properly, I loved it. Now and then I did lockup on a BBS, but it
wasn't a big problem. And now that their prices are down, it would be
more of an enticement for me to get one if I didn't already have one.
A lot of people gripe about all brands of modems. Heck, they all will
give you problems if you don't have them Configured right, if you have
excellive line noise on your phone line, and other problems common to
all modems.
Just buy one of whatever brand you like, and return it if it doesn't work
out for you. Simple as that....

This is the SAME Ofir Gal who writes for ST Review?

If so, I want to say (as a Canadian Reader) how much I enjoy reading ST Review - there always seems to be something there of interest for me to read.

I use a 1040 STe hooked up to a homemade 40 meg hard drive (utilizing ICD's Link II) in a mini-tower case (planning to hook-up a CD-ROM and larger hard drives in the near future), an SM125 monitor, a 2400 baud modem, and a Canon BJ-5 BubbleJet printer. I use my ST system for telecommunication, sign design for the hardware store I work at (using Calamus 1.09), and MIDI work (currently using Notator SL 3.2, but trying to get to grips with Logic 2).

I also do some writing for the PHOENIX, the club newsletter of TAF (Toronto Atari Federation), possibly the largest Atari 8-bit/ST/TT/Falcon user's group in North America, and the largest in Canada - right now we are standing at just over 300 members.

If you or Vic would be interested in doing a story on how North American Atari users are getting by with our machines in situations where we have even harder access to finding machines, parts, software, etc. (since the STs have never caught on in North America as readily as they did in the UK and Europe, therefore a much smaller user base - although Canada is a much larger userbase on the whole continent :)), I'd be willing to be the perfect guinea pig - or could direct you on interesting people to contact. How about it?

Mike,

Although I understand your concerns, the simple fact is that neither John nor I have made a single dollar from our Atari products for well over 2 years now. All of the income, even from the latest versions of Warp 9, has gone into the running of the business.

>> I always liked there stuff, just wish they speant more time
>> enhancing the programs instead of complaining about Atari and
>> foreign programmers.

Unfortunately, mortgages and phone bills and all that other mundane stuff gets in the way sometimes, and both John and I have had to find other ways to survive; he's been working as a music proofreader for Fox, and I've been playing guitar with Al Jarreau.

As for complaining about Atari, well -- those days are over, because there just ain't anything left to complain about.

I am not flatly against the idea of shareware, but I don't have a lot of
respect for peons who ask for $25 for a baseball card database written in
GFA Basic, not when there are people out there like the FSF and Linux folks,
who distribute entire *operating systems* in the public domain, source code
included. The more of this sort of thing I see, the greater my disdain
grows for people who think that I should be so impressed by their super-
crippled demo version that I'm going to send them money.
I like the idea of offering interested users a laser-printed manual, or
a data disk with extra levels and an editor, or whatever. I don't even
mind paying a little extra for such things to register my support for the
software. However, when people don't give you anything but a crippled demo,
I consider it nothing but a waste of diskspace. I don't think its software,
but rather advertising, and I'd like to see as little of that on the net as
possible.
As a programmer myself, its a big ego-trip to see people using code that
I've written. However, its worth a lot more to me to see people be able to
get code up and running than it would be for them to have to wait six weeks
just so I could get $15 in my grubby little hands. Wanting to make money
programming is fine - write something good enough that a software company
will market it or hire you - but many shareware author's conception of
shareware seems counterproductive and annoying to me.
Granted, this is all just personal opinion, and folks can do as they like.
As for me, I will continue to support the concept of _sharing_ my code,
because I love programming, and continue laughing belligerently at people
who think I'm going to send them $20 for the "registered" version of software
I can't use otherwise.

Actually, some low cost 14.4 modems (i.e. the Zoom 150) have software-
based v.42 & v.42bis. I had one of these modems for about a week before
exchanging it for a US Robotics Sportster, since I couldn't use the
v.42 on my Atari (the packaged software was, of course, for DOS & Windoze).
Line noise is really a pain on a high-speed modem with no error correction,
by the way, and I now love how I can impress my non-v.42 friends with how
I can pick up the phone handset, scream into it at the top of my lungs,
and be plagued with nary a bit of line noise. :-)

If your machine is afs-mounted, you can cd right into the umich archive directories, which is superior to ftp for all sorts of reasons: you have access to the full unix command set rather than just the limited ftp set (i.e. I can directly do something like 'grep *warez* 0index |more' without having to copy 0index to my home directory first.) You also don't have to worry about the max number of users on the system. Probably the easiest way to tell if your system is afs-mounted is to try something like 'cd /afs/umich.edu/group/itd/archive/atari' from your csh prompt... I know that a whole bunch of .edu sites are on afs, so this should help some of you all...

>at all costly.

I don't believe in "expencive" as beeing the reason. Okay, we can ruin ourself
everyday in software if we wanted that. But if you really need a program,

i have this feeling many people would buy insted of pirating. And this "really need" is far more less than we normally thought. (Thats my guess ofcouse, taken from my own life).
So this is what i mean:
We have a guy somewhere in the world. He has a pirated copy of some program. Maybe he use it now and then. Maybe he don't use it at all. He just have it. Now, this can't possible be counted as an lose for the author, cause this guy wouldn't have bought it anyway.
This may sound naive, but i really do believe that the situation here.

>Not necessarily. I put the restrictions in there as a means of encouraging

>is out right now is a Shareware version. ANd if you register, you get te
>incentive of more functions at your disposal. It is not a demo or freeware.
>

Excuse me for saying this, but everytime i see a program with limits in, i judge it as beeing a demo. And those limits can be activated if i pay what the author. Thats the idea of demo'ing a program, or whatever we talk about.
About shareware, i'm not sure if any laws has been written. But here the author decide what it is, and his words are the law. The problem is, (and this i'm sure about), shareware is a fully working program. You pay for what you see, just as simple as that.
I know many programers use shareware with limits, just to make people registre.
I also welcome shareware much, cause thats what i seak. An opputunity to test before buy. But how on earth do you test a program with limits in ?

Real shareware does exsist. (Starball is a good example).

Micheal,

The DJ520 only does the 600x300 when using internal fonts. Therefore, there is no point in writing new drivers for it. As far as your software is concerned, it is a DJ500.

>the English version that I brought of Script never had a English Dic,
>only USA one, the usual problem with German software...

Thesaurus no, Dic yes. I compiled the english dictionaries a week ago,
based on word lists from Proximity Inc. for British and American English
with about 78000 and 90000 words respectively. Both dictinaries ship
with the english papyrus.
A German thesaurus and translation dictionaries from German to different
languages will soon be available as "LocateIt", which communicates with all clean
word processors and editors via the GEM clipboard.
For English I don't know, but anyone could write such a tool.

> or what resolutions it supports or the memory requirements...

Papyrus standard runs with 1 Meg (about 100 kB left for documents&fonts)
though I think HiSoft doesn't distribute this. Papyrus GOLD needs a
little more than 1 Meg.
The minimum resolution is 640x400.

Len,

to begin with, I generally post all the posts being mailed and
sent for approval to comp.sys.atari.announce, this may take a few days.
However as a moerator I have no control over how long a post will be up on
the newsgroups, at least not with the guidelines I was given.

If you posted something for comp.sys.atari.annouce and it has still
not been approved for a few days then you should send me a note if you could
so that I can check what happened.

Thanks

Yat

Stuart,

just treat comp.syst.atari.announce as a regular newsgroup and post
it usin whatever reader you have, if you prefer though you can email
atari-announce@lexicor.com (this is generaly used for posts coming in
from CIS or Genie who do not have direct usenet access).

Speaking of line noise, I have a Supra Fax Modem 114LC and use it for
a dial-up Internet account and GEnie. If someone was to pick up another
phone my modem/comm program gets screwed up. I thought the modem is
supposed to re-negotiate baud and keep the connection. I've noticed the
baud rated drops (via the led's) occasionally by itself but the
connection remains ok. Is lifting the phone's receiver too much noise?

Kevan Winch (Kevan.Winch@eccles.seuk.com) wrote:
: Hi,

: Can anyone shed any light on the cheapest way to attach a HD to my ST ?
: What do I need apart from the HD ? Can I use IDE drives or what ?
Hmm, I am using a little interface PCB I got from the German magazine c't
with an 80 MB hard disk.
Although it's a kit and I had to solder it myself, it has been working
rather reliably for the last 3 years.
It's still available, I think, and the kit costs about DM100,-- .

However, I found the software a bit spartan --- no tools to clean up clobbered
partitions and such (suggestions where to get programs to do this are *VERY*
welcome).

Well, if you're really interested in this, you might try to contact the editor
in charge, name's Christian Persson, I think, and his Email
should be cp@ct.ix.de.

Hope this helps...

Cheers, Christoph.

1863. Huge Atari ST sale

Newsgroup: comp.sys.atari.st
Date: 1994-08-08 04:48:57 UTC
From: jrl8@namaste.cc.columbia.edu
Message-ID: <324dfp$rb8@apakabar.cc.columbia.edu>
Source record: 182510
Cross-posted to: comp.sys.atari.st,ny.forsale,nj.forsale,misc.forsale,misc.forsale.computers.other

I have the following Atari ST equipment for sale. I would like
to sell everything together, but would consider serious offers
to break up the systems.

Atari 1040ST computer system w/mouse (TOS in ROM)
(includes built-in 3.5" drive)
Atari 520ST computer system w/mouse (TOS in ROM), works sometimes

2 Atari SC1224 color monitors
Atari SF314 double sided 3.5" disk drive
Atari SF354 single sided 3.5" disk drive

Supra 30 megabyte fast hard disk with NeoDesk operating system

All power cables, power supplies, and cables are included to
hook up everything.

The following software, all with original disks, boxes, and manuals:
Word Writer 2.0 Timeworks (barely used)
Timeworks Desktop publishing Timeworks (with bound manuals, never used)
Crazy Cars Titus
International Soccer Microdeal
Wizards Crown SSI
Questron II SSI
Heroes of the Lance SSI
SDI Cinemaware Interactive Movie
TetraQuest Microdeal
Prime Time First Row Software
Starglider Rainbird
Starglider II Rainbird
F15 Strike Eagle Microprose
Rings of Zilfin SSI
Speed Buggy Data East
Typhoon Thompson Broderbund
Guild of Thieves Rainbird
Outrun Sega
Captain Blood Mindscape, Inc.
Road Runner Mindscape, Inc.
Road Wars Electronic Arts
Obliterator Psygnosis
Sinbad Cinemaware Interactive Movie
Defender of the Crown Cinemaware Interactive Movie
Pinball Wizard Accolade
Bubble Ghost Accolade
Ultima IV Origin Systems (+ cluebook)

Dungeon Master FTL (no box)
Virus Rainbird (no docs)
Moebius Origin Systems (doesn't work)

The following software has original disks and manuals but no boxes:
Aegis Animator/ST Aegis
Impossible Mission 2 Epyx
ST Basic Atari
Flash Antic Software
Block Out California Dreams
SimCity Maxis
High Roller Mindscape
Time Bandit Michtron
Barbarian Psygnosis
Airball MicroDeal
Airball Construction Set MicroDeal
Skyfox EA
Neochrome Painting Program Atari
UMS Rainbird
ST Wars Miles Computing
Chaos Strikes Back FTL
Swiftar Accustar Software, Inc.

Plus dozens of other games (Rogue, Test Drive, Sundog, etc.) with
just original disks (no box or manuals), plus a TON of shareware
on disks, plus old Atari distribution disks (DB master one, megaroids,
languages, etc), plus an entire collection of START disks representing
about twenty issues.

There are also duplicates of some of the software (Dungeon
Master, Time Bandit, etc).

I am looking for $895 for the entire lot.

Please call or email if interested!

Best regards,
-JRL

From: bensmith@teleport.com
Message-ID: <324kvi$9fn@kelly.teleport.com>
Source record: 182513

I have an Atari 1040STe for sale. Comes with 1 MEG of RAM easily upgradable to 4 MEGS using SIMMS. Looking for good home. Already has SIMM board inside. Has RF Port to let you hook up to TV, VCR, etc. Also has Monitor Port. Plus two extra ports, looks like Joystick ports, I've been told one is Apple Joystick Port, other is IBM Joystick Port. I was told it was done this way so Atari users could use different Joysticks than Atari? TOS in ROM, 1.62 better TOS. Also has Stereo Sound. Two RCA Jacks on back for Stereo sound.

First $250 takes it. Act now and I'll throw in a Mono SM124 Monitor.

Don't reply here as I don't read Message Bases often. My InterNet Address is bensmith@teleport.com or call Ben any time at (503)256-9974.

1867. [SOFTWARE] MiNTOS Release 1.4 now available.

Newsgroup: comp.sys.atari.st
Date: 1994-08-08 08:00:29 UTC
From: steve@earth.ox.ac.uk
Message-ID: <1994Aug8.080029.11615@euclid.earth.ox.ac.uk>
Source record: 182477

MiNTOS is now at Release 1.4!

MiNTOS is a package of utilities which run under the MiNT operating system extension for the Atari ST, TT and Falcon ranges of computers to provide a multi-user environment.

The environment created by using these utilities with the addition of the GNU file utilities is a very close approximation to a classic BSD Unix system, closest to SunOS 4.1.x and 4.3BSD.

Many of the utilities contained within the package are, in fact, ports of the utilities distributed on the BSD Net-2 tape.

What you will need to use MiNTOS?

MiNT version 1.04 or later, preferably 1.08 or above.
Minixfs 0.6 with a patchlevel greater than 8.
The GNU File utilities.
An Atari ST, TT or Falcon with 4MB RAM or greater. (It does run on my old 520STM with 2.5MB RAM but you can't run many things before you run out of memory.)
A hard disk with plenty of space free (about 4MB should be enough).
The GNU GZIP compression program.
The GNU TAR tape archive program.

What's new in Release 1.4?

Many bug fixes and a couple of new programs. The bug fixes include the trouncing of a glaring security bug in the Net-2 BSD login program.

The source distribution has a completely new Makefile set-up which makes building individual parts of the package easier, as well as making the build process tidier. (Linux-m68k hackers may recognise some similarity to their set-up here.)

The "/etc" directory is augmented to include sample MiNTnet config files. Also, the rc* files are now fully MiNTnet ready, though the names and places of the ip and rpc daemons follows SunOS convention rather than 4.4BSD's which is MiNTnet's way. (ie. daemons are found in /usr/etc and are named either in.xxx or rpc.xxx.)

The source distribution's libusers library has been merged with Kay Roemer's Portlib patchlevel 7 and has been augmented.

The source distribution comes with all the programs needed to build the package except for the C compiler, MiNT and Minixfs. The

source to Ash, the Bourne Shell look-a-like has been removed
as this is available elsewhere.

A version header is automatically generated during the building
process which is displayed by init when it starts up and is
written into the top of /etc/motd at boot time. (This will
help me track versions for bug reports.)

How do I obtain it?

Or you can use anonymous ftp from earth.ox.ac.uk:/pub/mintos or
your closest atari.archive.umich.edu mirror site below the Mint
subdirectory.

Note: This binary distribution was built using a version of the GNU C
compiler built for the Falcon/TT (mfgcc258.zoo from atari.archive's Mint
hierarchy). I used the -m68000 switch, so I hope it's generated correct
68000 code. I can't check this at the moment as my old 520STM is feeling
poorly.

Known Problems.

It seems that the BSD getty doesn't like Carriage-Returns in
/etc/gettytab, it fails to read it properly. The fix is to
make sure that all lines in gettytab are terminated by a
single Line-Feed character and not the 1970's hangover from
CP/M of CR-LF. I would suggest that you make sure that ALL
configuration files use the Unix standard of LF as the
end-of-line marker.

For some unknown reason the QUIT character is set to ^U rather than
^\ after you log in. I still haven't been able to track down
how this is happening, I've put a hack in the sample [t]csh
startup files in "/etc" to get around this.

What next?

Well, I hope to incorporate more of MiNT-net and re-add the networking code to
syslog now MiNT-net supports TCP as well as UDP packets. I'm also going to
replace last and finger with the Berkeley ones. Oh, I'm also going to fix
some more bugs! (init itself needs some looking at.)

When will I get the next version out? I don't know. I'm pretty loaded up at
work so don't get much spare time to work on MiNTOS. Suffice it to say that
I'll announce it on the MiNT mailing list, on the comp.sys.atari.st
newsgroup and on my World Wide Web page
(http://www.earth.ox.ac.uk/~steve/mintos.html) as soon as a new version is
available.

Source record: 182516

As promised last week, I've finally managed to upload a fistful of
software to the umich archive. Hopefully this will be a starting point for
others to do likewise and drag the archives for the atari out of decline!
Come on people! It only takes five minutes or so to upload that new disk
you've just found (even if it's only a game from a magazine cover disk!
There may be people who don't have access to it!).

Share and share alike, Atari fans. Commercial software is difficult to
find and if the PD/Shareware doesn't spread you may find yourself in trouble!

Remember, Your Sinclair was closed when it still had 30000 readers per
month. ST Format only has 40000.....

Blood.
Who doesn't want to see the ST killed by apathy...

>Perfect It wasn't free but it was damn cheep.

Speedo 4.2 was supposed to be able to handle non-retail encoded Speedo
fonts (ie X11 ones). The Word Perfect font pack is about 30GBP, also
Compo do a couple of good font packs: 50 useful looking fonts for
50GBP (roughly).

IMHO, the good thing about using retail Speedo fonts is that because
they are in a protected format, the quality of the font is guaranteed.
With the average cheap (or free) TrueType or Type 1 font, this isn't
the case.

: In article <5q9w82e.paulseniura@delphi.com>, paulseniura@delphi.com writes:

: [side note: The most users I've seen at a time was something like 230,
: and I was still getting 400k/sec transfer - admittedly I'm just across
: London, but nonetheless...]

I must admit, myself, that I used a.a, and src.doc.ic.ac.uk (it's mirror) for software, having been put off hensa for quite a while. I did start off with hensa, when I got into comms......

Then, the lack of upto date software put me off this site, and I went further afield, to what was then known as Terminator (now, a.a).

Thanks to Lee, we soon had that site being mirroed at IC.

It is fast at all times......but so is hensa. 8)

When I saw the job advert for hensa, I thought that it was my chance to do something for the Atari section. I was lucky enough to get the job, and am still bringing in software, which i thought should have been on-line ages ago. The Atari sectionm was neglected like anything for quite a while.....these peecee users here in this office......

But, I am not surprised.....the Atari here is from 1987......8 Mhz Mega ST.....the PCs are 386s and 486s.....and the ST gets compared to them.....stupid I know. Well, I'm just waiting for a Falcon now for the workplace, and then we'll rock. I also hope to upgrade the Mega....memory, disk space, speed.....

Many people don't know this, but hensa is a different kind of archive site. We are not ftp only.....users may log in via telnet too, and gopher, and WWW, and via dial-up, and we also have a mail-server.

The software put on-line is first tested to see if it is worth putting on-line, and just so that I know what the program does, etc, bugs, etc. In effect I support the software I put on-line. For some programming stuff, and MiNT stuff that needs mint version greater than 0.95, I cannot really support the software yet, even though it is/will be on-line. I am hoping to get latest mint versions (either compile them, or receive them from someone...with permission from Eric, of course), and then be able to test the sofware.

The Falcon software on-line, is too, as yet, untested.....but I have a couple of people who do test them for me....just some of the packages...but this will change soon, when I get the Falcon....All other software is tested.

So people may write to me, and ask me questions about the software, and any problems they are having, and I can easily reply to them.

: ! (And I've yet to figure out why Hensa has to make
: ! their filing system so complex!)

: Ah come on, Denesh has no say in that AFAICT. Personally I'm happy to
: have any site, even if it is a little more difficult to navigate.

Thanks Simon.....I have no say in the matter...you are correct. Even with the way the software is stored on hensa, it does have it's advantages. For ftp it is a bit of a hassle to use....but if you use gopher or WWW (which a lot more people are using now, according to our log files), then it is very easy, and IMHO, the best around. I do not think that other archive sites can beat our gopher, and WWW servers. Try them...Comments are most welcome. These have keyword, searches, and alphabetical searches, etc. Go to the file, press return (gopher), or click on the file (WWW), and it's downloaded to you directly. No need to type in a transfer protocol, like I have so often seen on many archive sites.

Obviously, I will be slightly biased toward hensa, as I work here, but I do not doubt for one secong that a.a are better, otr the mirror sites are better than hensa....they are for latest software, as it just gets put on-line. Here I don't do that. I try to provide a service different to 'normal' ftp sites, as mentioned above.

So for latest software...you go there....for fairly latest software, (2 -3 days after realease), you come to hensa. Remember, hensa is also the official site for software that Joe Connor supports in the UK, and also the official site that CyberSTrider supports in the UK. These files appear on hensa first, then anywhere else. ;->

As to why such odd storage at hensa:

When service started, envisaged to distribute on ANSI format tapes. So every
file needed a different name. Thus package codes.

However, worked out quite well, for gopher and WWW, where we are able to create
different lists and search lists, pointing to diff directories holding the
software. Also, .msg files can be kept with the software package, in the same
directory. This way, people do not have to download the whole package to read
the docs. They can just read the .msg files, and decide whether they want the
package. Each package directory may also include a .rvw file, which is a review
of the package. Reviews can be done by anyone. So if anyone is willing to write
one for a package, then send one over, and I'll include it.

There may also be .bwr files (beware files) which list problems with
the
package, and bug reports.

Regards
Danny

Matt,

The problem with this "selfless, generous act" is that it leaves people without incentive to register, unless they have a conscience. When there is an incentive to register a program, they are more likely to do it than if the entire program was there and registering only eased their conscience; nothing more. I think what is needed is to address WHAT the author is disabling until it is registered. For my program (an ANSI art package called FANSI) I disable a few of the drawing features, BUT I leave such features like Saving and a few of the more bare bones features intact. The fact is, there are a lot of dishonest and borderline dishonest people out there who won't register a program if they aren't given a reason to. Unless there is some form of incentive towards registering, some people will just keep the program and not bother to send in any money for it -- or may do so whenever they get around to it. But the urgency isn't there. The incentive is missing. For people like me, this is just as good as not registering at all, since I'm not by any means a rich person, and for me, the quicker people register, the better off I am -- and I'm not at all well off to begin with.

Simply stated, giving a whole program with no restrictions and hoping to get registrations for that won't work as well as putting in some restrictions to be removed at time of registry. It's just a sad truth.

The "word" was actually from the UK distributor of NVDI who has been
using beta releases of both. He actually gave a figure of 9 times
faster than Speedo 5, although this is *likely* to be referenced to
Speedo and no NVDI :-) But I agree, they can't really be compared
until both are released.

Is it possible for Compo to release details on how to write GDOS
device drivers, as the lack of drivers for certain printers has always
been a problem for GDOS apps.

Indeed. Though cheaper than money orders or whathaveyou. I suppose it's a
tradeoff: Safety for cost.

> I have one dealer living on my island, (not an real island, but thats what
> it's called), and one living on the other side of the country. The dealer

Doesn't sound very promising. I suppose here in Toronto we are in something
of a better situation, with at least three dealers who stock Atari on a
regular basis, and at least one of them who is quite positive about Atari i
n general, even if his general sales attitude leaves something (a big
something) to be desired.

> I don't believe in "expencive" as beeing the reason. Okay, we can ruin

> guy wouldn't have bought it anyway.
> This may sound naive, but i really do believe that the situation here.

I have a similar thought, in that someone who pirates a program likely
wasn't going to register it in the first place. This may not be completely
true, as there are borderline pirates who will pirate a program if the
opportunity presents itself, but will buy it if it doesn't and they do want
the program. But of all the pirates out there, I'd say that these likely
make up a very small percentage.

> Excuse me for saying this, but everytime i see a program with limits in, i

> shareware with limits, just to make people registre. I also welcome
> shareware much, cause thats what i seak. An opputunity to test before buy.
> But how on earth do you test a program with limits in ?

As I've said in a previous message to Matt, the problem with that is the fact that the incentive is gone; there is a far greater chance that someone will not register if there is nothing to MAKE them register. If the incentive is gone, they lose any reason they may have otherwise had to reghister, and the chances are, they won't. The way I see it is that they need some incentive, some reason to make them register -- to get something extra when they do register. In my case, a more powerful version of the prorgam that has more features in it.

(pardon my brevity, but I'm running out of time here)

1880. ? ICD host adapter and Quantum 105Mb disk

Newsgroup: comp.sys.atari.st
Date: 1994-08-08 13:26:30 UTC
From: robinp@sherwood.uk.sun.com
Message-ID: <325bq6$sah@uk-usenet.uk.sun.com>
Source record: 182526

I hope somebody can help here :-)

I have connected a 3.5 inch Quantum 105MB SCSI disk via an ICD host adapter to my ATARI 1040STe but I am having a few problems.

The drive is recognised and can be formatted/partitioned ok but I can't install an auto-boot on it - I get spurious error messages such as "verify error" or "disk full"

When I try and write to it I get these types of errors - but I can zero the partitions and I can even sometimes write small files to the drive.

I have disabled parity on the drive and I have disabled verify from the ICDBOOT file but still no good.

Has anybody any experience with this type of drive ?

Is this drive suitable ?

TIA,
Robin Peatfield.

1882. Re: Atari/amiga Article In Em

Newsgroup: comp.sys.atari.st
Date: 1994-08-08 13:42:21 UTC
From: df@zippy.nimh.nih.gov
Message-ID: <df.776353341@nih-csl.dcrt.nih.gov>
Source record: 182527

I received my copy of EM this weekend and read the article. It wasn't bad but there were some errors. One paragraph stated that Amiga sales were steady despite the liquidation. Maybe true elsewhere but not in the USA. There is a court order against selling Amigas here. Considering that this is a US magazine, you have to question how well they researched the material for this article.

1884. Falcon030 Accelerators

Newsgroup: comp.sys.atari.st
Date: 1994-08-08 14:30:01 UTC
From: atariforce@aol.com
Message-ID: <325fh9$djq@search01.news.aol.com>
Source record: 182530

I've noticed that there are basically two types of accelerators for the Falcon030's processor direct slot. The first type only uses a faster clocked 68030 while the second type also has the option of using TT-RAM for improved performance.

The problem with the first type is that the 68030's 512 byte cache is just too small to achieve the type of performance we desire while the second type is typically too large to fit into the Falcon030's regular case.

But there seems to be a third alternative. Why hasn't anybody developed a Falcon030 accelerator that uses a large second level cache?

Most PC clones typically use a 128K to 256K second level cache and these seem to work fine. A Falcon030 accelerator using such a design would probably be able to fit entirely in the regular Falcon030 case and offer performance close to that of a design using TT-RAM.

1885. Help! Quantum 80S to Atari ST

Newsgroup: comp.sys.atari.st
Date: 1994-08-08 14:42:10 UTC
From: derek@masque.demon.co.uk
Message-ID: <776356930snz@masque.demon.co.uk>
Source record: 182550
Cross-posted to: comp.sys.atari.st,comp.periphs.scsi

I am attempting to get a Quantum 80S SCSI 80Mb disk working on an
Atari ST computer, and was wanting some help if possible.

I am successfully running an OMTI SCSI-RLL converter and two drives,
but keep on getting error messages when attempting to access the
Quantum, though the software recognises the drive's presence
correctly.

The drive did originally come from an Apple (I think) if this sheds
any light on the matter.

Only clue to date: I see an error message about invalid data in the DCB.

The jumper settings are:

OMTI is ACSI/SCSI address 0
Quantum is ACSI/SCSI address 1

WS - not set
EP - not set - if set, prevents any communications!
SS - not set

Please reply via email, as I don't read these groups normally.

Thanks in advance for any assistance.

Derek.

Don't forget that there is a 3rd option that allows you to get your 68030
running at 32Mhz including the co-pro and you don't need to go near the
processor slot, it just solders onto the motherboard at a few places. Very
cheap too - in the UK they cost about 60GBP.

```
The Revenge Document Displayer - The Future???
----------------------------------------------

Owing to increasing work commitments I am no longer able to spend as much
time developing the RDD as I would like to. I am therefore looking for
someone to continue development of what must be the fastest general
purpose document viewer on the Atari range of micros. Whoever takes on
this task must be conversent with C and 68000 assembler and have a good
working knowledge of the Atari hardware. The RDD is written in Lattice C
v5.60 so owning a copy of this is obviously a pre-requisite.

If you would like to take on this challenge then please E-Mail me. I shall
be monitoring this newsgroup also.

Regards,

Stu...!

1891. Re: Atari FTP sites are unaccessable &/or useless!

Newsgroup: comp.sys.atari.st
Date: 1994-08-08 15:59:01 UTC
From: daveh@netcom.com
Message-ID: <davehCu84EE.H7J@netcom.com>
Source record: 182535

Would it be possible to get a.a.u.e mirrored to one of the main ftp repositories like ftp.uu.net? I think all that is required is for some at a.a to request it. ftp.uu.net as the advantage of being an ftp site only, it is accessible 24hrs a day with no limit to the number of logons.

Dave.

Damn straight! Have anyone noticed the fact that the two most popular personal computer systems (PCs and Macs) are designed (although I suspect it wasn't intentional in the case of the former) so that it is damn easy to upgrade their hardware?

Jakes

> with PC's in there arena, they must take computers to a higher level.

IMHO, one of the most annoying things about the computer industry today
is the fact that _all_ of the "gee whiz" factor is totally gone.

When I went from my Vic-20 to my C-64, it was a major leap in speed
(well, relatively major), RAM capacity, graphics, sound, etc. When I
went from my C-64 to my ST, it was another major leap.

Today, if you "upgrade" your ST to a TT, or a Falcon, or a PC, or a Mac,
you're just getting more of the same thing, but a bit faster, slightly
better graphics, slightly better sound (unless you buy a PC; IMHO, it's
not a computer unless it has sound as a standard, and most PCs STILL
ship without a sound card... the Vic-20 could produce better sounds),
etc.

Total stagnation. *snore*

Warp 9 probably is one of the top-selling Atari products. (Probably one
of the most pirated too, but that's another subject.) It's unfortunate
that the market has shrunk to the point where even that status isn't enough
to turn a profit. Having said that, future upgrades are not necessarily
out of the question -- but I'm not working on it at the moment, because
I'm touring with Al Jarreau.

I have a Spectre GCR with roms, and an SM125 mono monitor for sale.

I would like $100 US for the GCR, and $50 US for the monitor.

Included with the monitor is a video switcher so that you can switch between
color and mono monitor without swapping cables.

Anyone interested, or are the proces too high?

I'm running a BBS and for a while I had suspected that something was corrupting my files. I'd do a directory search and find 2 folers with the same name, but could not delete or rename them. Files would be missing, just whole bunches of stuff was happening. I though that since I boot of my hard drive someone might have concocted a virus that works on hard drives.

Subsequently, everyone on the "net" seems to say that this does not exist. I hope that's true. Since then I've cleaned up the suspicious parttion and have had no problems since.

Thanks for your input.

Matt.

In the case of email ordering, it is common to send the credit card
information via snail-mail (or via phone) once, and they keep it on file
for future orders, so it does not need to be included every email.

That said, I have no idea if Toad does them at all, let alone in a secure
fashion.

I think my newsreader misattributed this quote. If so I apologize.
(It appears that the previous post wasn't attributed in the post
I am replying to).

I think you have shareware confused with pd software. At any rate,
since you feel the way you do, I suggest you write some software
and give it away as a "gift from the heart." Think how good you'll
feel for doing such "a selfless, generous act". :-)

Personally, I'm just glad people are still coming out with
stuff at all, shareware or not.

1912. How to reduce size of GCC-compiled programs?

Newsgroup: comp.sys.atari.st
Date: 1994-08-08 22:15:43 UTC
From: robotron@moroder.demon.co.uk
Message-ID: <199408082327.AA00537@moroder.demon.co.uk>
Source record: 182546

I've been developing a suite of 15 programs jointly on an ST (with GCC 2.5.8) and a PC (with Microsoft C 5.0), and there's a clear difference in the sizes of the executable files - the ST binaries are almost double the size of their PC equivalents, even after compiling with -O2 and -fomit-frame-pointer and xstrip'ping the .ttp files.

I suspect that GCC is adding a lot of unnecessary baggage - for example, I don't need (or want) UNIXMODE support for this particular project. Is it possible to disable it (perhaps by redeclaring a function or two), or are there any other ways of reducing executable size, other than recompiling the libraries?

Thanks in advance,
Stephen

Yes, Toad accepts major credit cards. And as far as credit card fraud is
concerned, in the U.S. the law limits your liability to $50 per card if
your card (or card number) is stolen. I'm not sure about internationally.

I'm looking for a good cheap ST to replace one which just
gave up the ghost for unknown reasons (possibly a recent thunderstorm).
The monitor and at least one double-sided drive still work fine, so
all I need is the computer itself.

Obviously I'm looking for the most bang for my (few) bucks,
also. If you have a machine for sale, send details of the system and
your minimum price to

seawasp@telerama.lm.com

Thanks!

If I only get a couple answers, I'll probably decide on a
machine within a few days. If I get lots of replies, a final decision
will probably take about two weeks.

I totally agree with you. Bitstream makes excellent fonts, and since you cannot get Speedo fonts elsewhere, they'll always be top notch. Speedo are also extremely fast, compared to TrueType and Type 1, and there's no question of that performance being corrupted by amateur or careless designers.

1919. Suggestions wanted for Atari ST sequencer

Newsgroup: comp.sys.atari.st
Date: 1994-08-09 01:01:18 UTC
From: erholm@CS.ColoState.EDU
Message-ID: <Cu8tI6.1q7s@yuma.ACNS.ColoState.EDU>
Source record: 182456
Cross-posted to: rec.music.makers.synth,comp.sys.atari.st

(apologies if this is an inappropriate newsgroup)

I am looking to buy a MIDI sequencer for my Atari ST. I have not really even looked around much to see what's available nowadays. The most outstanding feature I've seen from this type of software is the price! One package goes for $900! Yikes!

Now a $900 piece of software might be just what a professional musician needs, but I'm not a professional, and don't intend on ever becoming one. I would just like a nice little sequencer that has good recording and editing capabilities. 16 channels is all my keyboard can handle, so I don't need anything with more capacity than that. Even just 8 channels would be okay.

The cheapest sw I've seen so far is called Sequencer One from a company named Oregon Research. It retails for $40. Is this just a piece of junk?

I really don't want to spend over $100. Anyone have any suggestions for either shareware or commercial software? All comments appreciated!

AD thanks VANCE,

: I think that there are way more people out there who don't care a damn
: shit about what you regard as a "standard" but will need an access to
: cheap vector fonts. And that's exactly what NVDI provides.

Fair enough. But on the other hand, there are folks out there that care
about quality vector fonts.

: What I've seen of SpeedoGOD 5.0 (and I haven't seen that much of it) was
: a hack, that did run into enormous trouble as soon as it came to using
: GEM text attributes. It furthermore crashed the scaler as soon as I used
: Mac- or some PC-encrypted fonts and was helplessly slow. But, you're right,
: it feature more font formats as NVDI.

I think you're being unfair; you should spend more time with it before
making such judgements.

1. SpeedoGDOS 5 is not a hack... you're completely wrong.

2. Text attribute stuff is largely unchanged from Speedo 4.x. If there's
a bug, it's been in there since the beginning. Of course, we'd want to
fix it, but in the past I've seen lots of text attribute bugs that were
due to applications, not SpeedoGDOS; I have yet to identify a bug in
SpeedoGDOS with regard to text attributes.

3. With regard to crashing on some encoding schemes, it was a bug that
was fixed before SpeedoGDOS 5 was officially released (the version at last
week's UK shows was one version prior to that). Our customers won't have
that problem.

: But, anyway, let the people buy whatever they think they need...

Well put.

Thanks,

Robert@COMPO

1921. RSVE hardware available now.

Some people may remember I said I was relaying & manufacturing the RSVE serial accelerator board...

Well, they're here now 8)

The board is designed to sit on top of your MFP (though you can put it somewhere else instead if you like), and requires you to cut one pin on the device and solder four wires. I'd put installation in the 'average hobbyist' range. (obviously on a MegaSTe or TT it's not going to sit on top of the MFP because it's in a different package...)

I'm asking $50 Australian for it, including P&P anywhere in the world. This also nets you english installation instructions, and includes a royalty to the original designer.

Please note that I'm hardly covering my costs here - hence the significantly lower than expected price. I'm not out to make my fortune on this one 8)

If you're interested, send me some mail & arrangements can be made.

mike

PS. If there's some other gizmo like this floating around that you think would be useful to the ST community, let me know.

Why pay for sequencer one when you could get it for free from a PD
library.ST Format where giving it away as a cover disk . If you don't
want anything great then this may be the one for you.I have never used it
but ST Format gave it a rave. I use Creator , it being the cheap version of
Notator, it does everything i could possibley want.

There is a program called C-FONT available from the ST Club (or maybe
COMPO also) that converts CALAMUS fonts to GDOS, WRITE-ON and THAT-S
WRITE fonts. And there are tons of Calamus fonts available in PD but GDOS
seems hard to find.

Hope that helps some.

I have both NVDI and SPEEDO4.2 installed (along with the drivers aoutline accesories) but if NVDI is on the I cant use my Speedo fonts. Could someone than has both working together send me their config files? (assign.sys and any tips you have for fixing the problem?) thanks a lot

Also, can anyone tell me how to install a new system font with NVDI? Every time I cange the assign.sys file from the regular font it ignores my changes and doesn't do anything.

Oh yeah, my system consists of a TOS 4.04 Falcon 4MB/85MB + NVDI+Blowup030 Hard I.

...or get a new case for the Falcon to fit both the upgrade and another hard drive while you're at it...

BTW, comparing hard drive prices is easy, just find the price per megabyte.
How do you compare accelerator prices, price per %faster? I purchased
NVDI for my Falcon because it sped-up graphics 300-1000% for under $100US.
Power up is 15% for $150US. (conversion)
A 68040 accelerator is 300-500% for over $900. (estimates)

What's wrong with this picture?
(I know, NVDI doesn't speed-up rom/ram access. But the price!!!)

Well, pick up an ST magazine...and here are my opinions of what to get:
Toad computers has practically all of them, and all of them reasonably priced.

For starters, I'd recommend Tiger Cub...since that's what I learned on, and it seems pretty easy to use. It costs $29. I don't know if it has support anymore or not, but it does work.(It even has a nice editing system).

I'd stay away from Sequencer One, since I don't believe it does anything except for record sequences. Sequencer One Plus seems much more plausable, considering it lets you use your ST as a sample playback synth for your own(if you have a cartridge sampler) samples. Granted, you'll only have 8bit quality, but that's sufficient for a lot of sampled speech. Personally, I'm considering getting it, just to see what it's like.

KCS Omega is only like $50 now. This used to be a $300 package, and they marked down the price. Heck, they even gave it away with some european magazine, albeit w/o the manual...(ST Format, I believe? Sometime earlier this year). You might want to try it out. Keyboard Magazine for some reason rates this nearly as highly as Notator and Cubase...but I just disagree. The latter two are much easier to learn and more straightforward. I know one person on the net disagrees with me about KCS, but to each his own.

I guess the other thing I would possibly recommend is Breakthru, which was given a Future Music Platinum award. If you buy the Replay 16 sampler, in conjunction w/ Breakthru(basically Sequencer One Plus on steroids), you get a free 16bit 4 voice sampler in the deal. The sound is pro quality(I suppose). the breakthru software is a 64track sequencer, I believe...and costs...like $250...and I think you could get a replay 16 for around $150...not a bad deal.

So...those seem to be your options. I don't know much about the software by the Barefoot/hybrid Arts company...so I can't recommend any of it.
shrug

right now, I'd suggest going for Sequencer One Plus...it's not that expensive...and it allows some decent editing once you've done your initial recording.

It has a complete English dictionary (Collins?) and the facility to
create new dictionaries from ASCII files, an English manual, but no
thesaurus. It works in any graphic mode >= 640x400 (ie not medium or
low ST resolutions), and requires 2Mb of RAM.

You can print using GDOS, or you can create your own printer drivers
in the program (easy to do, and you can still use Speedo fonts)

It is very very (very!) good.

1938. SpeedoGDOS 5 Compatibility problems

Newsgroup: comp.sys.atari.st
Date: 1994-08-09 09:08:45 UTC
From: vctec@westminster.ac.uk
Message-ID: <Cu9FwB.9EK@westminster.ac.uk>
Source record: 182475

How compatible is Speedo 5, with applications that use GDOS? Anyone know?

AFAIK, Compo's Speedo 5 is different to Atari's Speedo, and so this worries me, in that applications which used Atari's Speedo, or older GDOSs, will bomb out when using Speedo 5.

A couple of people have already told me that Speedo 5 is incompatible with a couple of programs which worked fine with other GDOSs.

Any ideas anyone?

dan.

STIRRE31@MAINE.MAINE.EDU wrote:
: I get the same messege when dealing with the Cain Newsletters.

hehehe

The cain files at hensa are fixed...or rather have been fixed.....

hehehe

See the advantages of going to a site that supports the
software.....hensa does....

The people at cain, I informed a while back, and they are looking into
the problem.....the damaged zip files can be unzip'ed on a unix
machine...theres an extra 128 bytes of data at the beginning of the
file. The ST will just not take this. What I have done at HENSA, is
that I unzip'ed on Unix, downloaded to the ST, zipped with ST-Zip, and
then uploaded again, to hensa.

These files can now be cleanly unpacked on both Unix, and the ST, and
also on a PC.

Remember, HENSA is the official site in the UK, to get CAIN....

get it from micros.hensa.ac.uk, under
micros/atari/tos/n/n153/

or via WWW, gopher, and do keyword/alphabetical searches.

or via terminal sessions, where you may search for files via grep.

|> libraries?

If you are using -lgnu then you should switch to the MiNT-Library. It does not contain a full UNIXMODE emulation, just the basic things (/ -> \, root directory, binary vs. text stdio). Another way to reduce the program size is to add #include <minimal.h> to your main module, but then you cannot use stdio any more. Also there is a library -liio which removes the support for floation point i/o from printf and scanf (which is probably the biggest gain on a plain 68000).

I have a FaST directly from ICD, with a Quantum 105 installed, so the combination does indeed work. But, as it was already formatted and partitioned when I got it, I can't help you on the specific solution to your problem. I will, however, forward your post to Tom Harker at ICD, for his input.

Contact J. Patton at Atari Corp. I've just heard he is responsible of the JPEG decoder, at Atari. The price should be only US $100. If you buy the licence to Atari, you can then contact me for any information regarding the JPEG decoder, if things are missing in the docs (I never saw the docs, although I wrote the program:-).
If the decoder is too slow for your application, you can rewrite a small TSR, which installs improved 'DspBlkBytes' and 'DspBlkWords' functions. I tested it and the decoding was about 20-25% faster.

Now, how to contact J. Patton:
email: 70007.1072@compuserve.com

I wish the situation could be better, cause that would hopefully give a better
market too. But it just doesn't work here. I keep my 4 atari machine because
i like them, and because i'm a musician. And for the musician here in Denmark
the situation looks far more better than for the common atari users.

>I have a similar thought, in that someone who pirates a program likely

I don't know the exact pricing, but from what I've heard the new NVDI will cost exactly as much as the old one - even though it now includes a vector scaler. That means that upgrades will be significantly cheaper than a new NVDI. But you should ask the programmers or your distributor about that.

1949. Question about animation

Newsgroup: comp.sys.atari.st
Date: 1994-08-09 14:10:21 UTC
From: vicb@clark.edu
Message-ID: <3282od$eus@clark.edu>
Source record: 182496
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings,

I have a question regarding animation technique.
The scenario is that of having a single pixel move across the
screen in a straight path, making jumps of about 3-4 pixels between each step.

If I do this with a refresh rate that matches the monitor's speed (50 or 60
Hz, depending on the setting), the movement is very smooth, and it looks like
a single point traversing the screen. However, if I delay each step by
putting in a delay of an extra vertical blank, the same animation looks like
two points are traversing the screen. In summary, the number of vertical
blanks between each step matches the number of points that appear to be
crossing the screen, up to about four or five, at which the eye can
distinguish the jumps. I tested this with an .FLM animation with just one
point moving as well as with a program.

Has anyone else ever experienced this or know why this is the way it looks, or
better yet, any ideas for getting around it? My starfield needs to run at 30
Hz, as the program is sure to need the extra time for other matters.

Any help appreciated,

Victor Bruhn

I am not sure why it is but they appear to have some extra header
on the front of the zips. I wrote a small programs which hacked
it all off up to and not including PK which is how ZIPs start.
It worked for me. You could try using the unix port of Unzip51.ttp
which is unlikely to be as fussy as STZIP or perhaps the PC ZIPFIX
program.

Doesn't the docs for Connect state that something will happen
to the program after it has been used for a certain amount
of time? The one thing wrong with this type of shareware
scheme, though, Matt, is that people could just keep reinstalling
the program before the time runs out....
I personally like the "annoying messege" method. The program is
completely intact and the user is constantly reminded that the
program he/she is using is, indeed, shareware.

>Are we talking about a Hard Disk Virus or a Floppy one, you don't need
>a Virus killer for floppy Viruses, most programs can check if a floppy
>has a bootable boot sector, if it has just change the first byte of the boot
>sector to 00, then you can restore it if it was a valid boot sector..

I don't remember if I posted this info, but according to the add, Beilstein does some odd things with "buffering" the boot sector to fool most virus detection algorithms into thinking the boot sector is OK. As to whether or not the virus is a floppy boot-sector only one, page 29 of issue 57 of ST Format has this to say:

When a virus killer program looks at the Beilstein Virus it
thinks that it is looking at a disk formatted on an ST with
TOS 1.4, 1.6, 1.62, 2.05, 2.06 or on a PC.
The virus also hides in other ways; it alters its own
code...it can show up in 650,000 versions. Perhaps the
sneakiest thing it does is to retain the original boot
sector of the floppy disk, so if you had an anti-virus
installed on a disk that the Beilstein Virus has infected,
you still get the all-clear message when the disk is booted
up!
When activated, the Beilstein virus can use one of 12
different destruction routines including wiping partition C
of a hard drive, deleting files after you load them,
corrupting the screen, resetting you ST and garbling printer
output.

It sounds to me like Beilstein is a floppy boot-sector only virus, but to be sure you might check with Oregon Research, or anyone else "in the know."

That issue of ST Format also lists "...the most common and troublesome types of viruses on the ST." Their list includes 33 different types of viruses.

>If it was the Hard Disks boot sector, then the Hard Disk would never ever
>boot....
>
>A Disk boot sector is only active if the disk is booted, not buy running
>any programs on it...
>
>So why all these rave about Viruses, the only one that could be a problem
>is the so called Link Viruses...

These are probably the greatest concern to hard drive owners, but any
virus that can delete hard drive partitions, files, or in any other way
damage your data is of great concern to me, whether or not I boot up with a
floppy very often.

They probably WERE ashamed, as they should. Showing the Falcon
is the same as showing an old ST with the keys painted a little
darker! How could that have a positive effect on sales?

> As for the computer side? Well, a faster processor definitely.
>What with all the talk about the Power PC, they should look at the

>should definitely be based on what they've learned from the Jaguar -
>that would be one happening machine!

The first thing someone must do *now* is to write a 120% compatible
alternative for MultiTOS which runs on the Power Macintoshes.
Preferably, I'd say, one of the German alternative OS builders.
(The 20% overcompatibility is for fixing design mistakes such as
the iconify protocol made by Atari).

> And a nice case with separate keyboard for it - and a good

I think a good idea is to have just enough things disabled to stop the
prgram being used as it is but enough left to show what it can do.
ie a wordprocessor which will do everything except save or print.
That way you will be able to tell exactly what it can do, but you will
still need to get a registered version to use it properly.

1963. ATARI STUFF FORSALE!!

Newsgroup: comp.sys.atari.st
Date: 1994-08-09 19:45:24 UTC
From: basil@shaggy.cis.upenn.edu
Message-ID: <328mck$7ag@netnews.upenn.edu>
Source record: 182414

I have the following ST equipment/software for sale:

1040 STf w/ Tweety Board (Not installed) $130
SC1224 color monitor 150
2400 baud Supra modem. 30
Wico Joystick (top of the line) 25
included Software:
Flash 1.6, Drivers for HP printers, PD disks, Neodesk 3.1, whatever
else I find.

Buy all for $300 plus shipping or buy separately.

Spectre GCR w/ ROMS and manual: $175 OBO

Music: Dr T's Tiger Cub $40 Great entry-level graphic sequencer
Hybrid Arts EditTrack II $40 Great professional sequencer
M1 Editor plus 500 sounds $35

Buy all three for $100

Games:
Ultima 5 $30
Ultima 6 $30
Populous $20
Populous/Simcity bundle $30
Populous II (awesome game) $30
Speedball $20
PowerMonger $30
MIDIMaze (Kill a Happy Face) $10
Dungeon Master $12
Chaos Strikes Back $12

Best off on the above, plus shipping. Or buy with computer for
discount. Most have manuals and original boxes.

Contact Brian Stokes at basil@graphics.cis

>alternative for MultiTOS which runs on the Power Macintoshes.
>Preferably, I'd say, one of the German alternative OS builders.
>(The 20% overcompatibility is for fixing design mistakes such as
>the iconify protocol made by Atari).

YES YES YES!!!! If this existed I would purchase it TOADY!!! This is exactly the sort of product I would love to have; essentially GEMulator for the Mac (but faster). The PowerMac will emulate a 33mhz 68040, so making a software only Flacon/TT/ST emulator would be a great (and FAST) idea...

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's 'Statistics of Deadly Quarrels'. You've probably never heard of it even though its relevance to the mess you're in is at least as great as that of Darwin's 'On the Origin of Species,' which you learned about in fourth grade. And that's because it's so completely terrifying only those 'experts' who are adequately armoured with preconceived contrary ideas which will enable them to disregard Richardson's work completely ever get to study it."

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <328ndk$ni3@golem.wcc.govt.nz>
Source record: 182408

After a couple of askers....

Antidote is share-ware, a fully functional older version is available as
part of Scriba Communis Responsi Disk-magazine, in the final issue.
(Number 10 I think).. It's available at:

atari/Magazines/Diskmags/Scriba/

on

atari.archive.umich.edu

The shareware fee is only about $10US and it's still being supported
and updated quite frequently!

For those not reading the thread, Antidote is a virus-killer for hard-drives
and floppies that handles boot & link viruses.

] months now, and so I am eager to try it. I am surprised I have not
] seen any posting about OMEn in this group since its release! any
] of you out there tried this yet?

It's a not-fully-finished program. The full package is somewhat expensive
for a multi-platform-compatible program. And the OS is too cluttered
(more so than windows). Also, there's been _no_ other software to appear
for it, and it's TOS incompatible making it pretty much useless!

Seems to multitask okay though! :)

1969. Misc computer Items, etc. forsale

Cross-posted to: misc.forsale.computers.pc-clone,misc.forsale.computers.other,comp.sys.atari.st,rec.radio.swap

I have the following computer items for sale that I do not need anymore:

PC Compatible accessories:
==========

Intel '83 C80287-3 mathcoprocessor $ 5
(was told it is for 6Mhz class machines)

8-bit MFM controller card $ 5

42 Meg MFM Hard drive and 8-bit half-card controller $45 (SOLD)

AST Advantage (TM) card ser/ser/par/game/memory card $10 (SOLD)
0.5 meg installed - either 4164 or 41256 to 3 Meg
Original manual + AST BBS files

Magitron 2.5 meg memory card (41256 only) $ 5 (SOLD)
1.5 Meg of 41256 chips $15 (SOLD)

100+ assorted 4164 DRAMS (15 to 30 ratings) $10 o.b.o.

AST SixPakPlus memory/ser/par/game/clock card $ 7 (SOLD)
64K to 1088k (128K installed)
AST BBS info files (configuration information)

National Semiconductor QuadFAX-96 9600 baud fax-only card $20
Original manual and software

ATARI ST SOFTWARE:
==========

Flight Simulator II (Atari ST TOS 1.4 version) $15
Michtron Super Conductor MIDI sequencer $ 5
GST C compiler $ 5
MIG 29 Fulcrum fighter simulator $15

Computers:
==========

NEC PC88 8088 Basic OS computer (ancient) FREE
Epson dual 300K 5 1/4" floppy (GONE)
daisy wheel printer
NEC analog monitor

digital VT320 terminal $50

Miscillaneous:
==========

TACTEC/TACTEL 6 channel ~450 MHZ xtal FM HT (rough exterior) $15
(have not personally tested - got two, need only one)
will throw in assorted business band xtals
no antenna (BNC style connector)

JVC VCR with bad motor. (will not engage on Play) $OFFER
4-head top eject (fisher price buttons ;-)

On all items buyer pays shipping. All items, to my knowledge, are in
working condition unless otherwise stated. Interested buyers can reach
me via the phone at (810) 394-0351 or on the internet via swood@oakland.edu.

1970. Forsale: Atari ST hardware - Lots of deals!

Newsgroup: comp.sys.atari.st
Date: 1994-08-09 21:22:47 UTC
From: selick@acs3.bu.edu
Message-ID: <328s37$opf@news.bu.edu>
Source record: 182405
Cross-posted to: comp.sys.atari.st,ne.forsale,misc.forsale

My brother is selling the following Atari ST hardware. He will consider breaking it up, but would rather sell the whole package for $600. Breakup prices are included next to each item. Please respond to <selick@itt.com> This message was posted about a week ago as-is, but apparently people had trouble e-mailing him. His mailer is back up now.

1040 ST - Tos 2.06, 1 meg ram, dsdd 3.5" floppy drive. Includes PC-Ditto II board which is not connected because it made the ST intermittant (note: the ST is absolutely solid without the pc-ditto board installed!) $200

SM124 monochrome monitor - $75

SM1224 color monitor - $125

150 meg MFM hard drive subsystem - includes Supra SCSI host adaptor, Adaptek 4000 SCSI -> mfm controller, and 1 Maxtor 150 meg MFM hard drive with 28 ms access, power supply, and a homemade case. Assembled, and ready to run! $175

Spectre GCR 3.0 with Mac 128k ROMs - $175

Okidata 92 9 pin printer - $75

Please feel free to make offers if you don't like the prices. Again, he will happily take the first $600 offer for the whole lot!

Call Bill eves until 10pm at 201-569-8421. Items are located in northeastern NJ. Prices do not include shipping. Please discuss terms with Bill.

Hello all,

I've heard so much talk about software which is on the brink of release.
Does anyone know the current status of:

NeoDesk 4
Spectre 3.1
Speedo 5
NVDI 3

I haven't seen any reviews yet which tells me none of this stuff is out.
I'll order a Neo4 upgrade once I know it's shipping - same with Spectre.

Thanks for any info,
Sam

[Article crossposted from comp.sys.atari.st.tech]
[Author was Bradley brown]
[Posted on Tue, 9 Aug 1994 22:45:23 GMT]

O.K. all, I've got one for you. I am currently using an Atari 520 STE with 4 MB RAM, 30 MB HD, and a "Thompson" color monitor. My problem you ask? I would like to use the color monitor with my VCR also. Now when I was back home I used a Thompson monitor with video and audio imputs. I just ran a couple of patch cables between the VCR and the monitor, set the selector switch to the #4 position, and Bob's your uncle! Now I'm here in Australia, Limited funds, another Thompson color monitor, however no video imputs. There is still the 4 position selector switch on the monitor, and a audio line level input, the video input from the computer is through a SCART lead with seperate inputs from the red, green, and blue, from the computer. I tried running the (line level?) output from the VCR into the monitor via the SCART connection, however the best I could obtain was a reverse black & white image. There is also another (IBM?) connector on the back that looks exactly like an Atari joystick connector. Any Ideas? Shotgun maybe <grin>

thanks heaps! bbrown@ozspace.brisnet.org.au

> guy wouldn't have bought it anyway.

I have software that I have bought that I only use "now and then". Mostly,
I'm glad I bought it. I also have purchased software that I "don't use it
at all". Of course, I'm not so happy I bought those items :-), but that's
still my responsibility to look (possibly more closely) before I buy.

In both cases, if I had simply stolen the software, it _would_ be "counted
as an lose [sic] for the author", because he wouldn't have my money. In
some cases, my money may also have helped to make it possible to improve
the software, when it wouldn't have been otherwise.

So your claim that "this can't possible [sic] be counted" is incorrect.

Also, where do you draw the line on using it "now and then"? If you use
a piece of software only once a month, you don't have to pay for it? How
about once a week? Two or three times a year? From where I sit, draw-
ing the line is easy: if you have in your possession a piece of software
that you _can_ put into use any time you decide to do so, you must pay
for it.

Of course, if it's something you only need once a year, and if you have
a friend who bought a copy, you could borrow it for a short time, and
then return it to him. This is no different from loaning a friend a
book, or my neighbor my lawnmower. Because we don't both _have it_ to
use at the same time.

I think part of the problem stems from looking at computer software as
a "product", when it's actually more of a "service". From the product
standpoint, a software thief hasn't stolen anything, because no hard,
physical object has been "taken". I.e., software is a "renewable re-
source", copyable an infinite number of times without reducing the
original. This provides an easy rationalization for the software thief.

From the service standpoint though, something in fact has been taken,
and it does indeed harm the developers and sellers. But this reality
is too esoteric for those who steal software, just as it is for those
who steal other services which are transferred electro-magnetically,
such as cable-TV, encrypted satellite transmissions, music-audio

media (records, tapes, CD's), synthesizer sound patches, sampled sounds, etc. If photocopying was as cheap & easy (fast) as copying a disk, we'd see it a lot more in the publishing field as well.

What it boils down to in all these cases for the "pirate" ("har, har, me matey's... heroic fellows we are!") is that if you can get away with it, it's OK. The rationalizations will follow.

What I prefer to do when pondering questions of right and wrong, is ask myself, "what if _everybody_ did it? would it still be OK? what would the impact be?". From that viewpoint, it's obvious: if only _one_ copy was purchased, and everybody else in the world made free copies from it, then that single copy would have to cost enough to pay for the entire development/production effort. And no-one would buy that first copy! So there would be no development and distribution of such products/services (or only at such a level as would be funded by public service agencies, philanthropists, etc).

As the Atari userbase shrinks (and if it's not growing, it _will_ be shrinking), we'll begin to see the impact of this _anyway_. As developers (and potential developers) consider the size of the market, and the number of copies that would be purchased, then determine the unit price that would be required (based on the development costs), there will be many software products that will simply never be produced for the Atari, because no customers would be willing to pay the substantially higher prices.

I.e., if I'm a programmer and I'm thinking of writing a "super-whiz-bang-whatsit" (and I _really_ like the Atari, so I'm going to ignore the fact that I could sell 10 times as many on the Mac, and 100 times as many on the PC), and I think a reasonable/fair selling price would be (say) $30, but I calculate that to cover costs and make a meager profit it would have to sell at $60+, I'm not even going to bother, because I know I'll be flamed for my "high prices".

Or, to put it another way, who would buy an Atari if software for it cost 2-3 (or more) times as much as for other platforms? You can find proof of this in the Unix workstation arena, where used systems (with big screen monitors) more powerful than any of the Atari's are available relatively cheaply. But there's not a big demand, because outside of (great) stuff like the Gnu software, the commercial software is mondo expensive... like 3-10 times what it costs on other platforms.

So those who "pirate" software are simply pounding nails into Atari's coffin, and eventually there will be nothing left but PD and shareware.

- Mark

P.S. In retrospect, as I was reviewing this posting, I did think of _one_ way that we could have all software be free, and freely distributable, even the commercial stuff, and have the producers survive and make money. Envision this, you're sitting there at your computer, working in a DTP package on a piece that has to go out the door that

afternoon. A chime sounds... the screen clears... and on comes a series of commercial messages from MacDonalds, Pepsi, Ford, and Reebok. Three minutes later, and it's back to work on your document (if you can remember what the hell you were doing), at least for the next 15 minutes until the next commercial break.

Let's see a show of hands for how many would like to see _that_ scenario come to pass!

I think this would be a neat idea as well. What would the technical
impediments be to emulating/running Atari TOS on the Macintosh hardware?

BTW: as far as I know the current PowerMac ROMs emulate a 68020, running
at approximately the speed of a 25 MHz 68030 processor.

1980. SPEED OF LIGHT 3.5 on a.a.u.e!!

Newsgroup: comp.sys.atari.st
Date: 1994-08-10 02:25:06 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <CuAs2B.9sz@beaver.cs.washington.edu>
Source record: 182428

The latest and greatest version of SOL 3.5 is out. I uploaded it to atari.archive.umich.edu and it is in atari/Graphics. I will upload it to some other ftp sites soon. This version adds lots of features and fixes tons of bugs. It also lets unregistered users access filtering and warping but with blank lines. New features include warping, improved filtering, clean JPEG loading (lots of options, octree, dithering, etc.), and many bugs fixed. The GIF saving bug in 3.1 was also fixed.

I will post a complete list of changes (for those interrested) in another article. It's pretty long (this is good!)

Hope you all like it, please let me know what you think (post, email, whatever.) I'm interresting in user feedback. This has given me a lot of good ideas for 3.5.

1981. Speed of Light 3.5 CHANGES.DOC

Newsgroup: comp.sys.atari.st
Date: 1994-08-10 02:27:55 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <CuAs6z.9ur@beaver.cs.washington.edu>
Source record: 182429

```
Changes in version 3.3 from 3.1
===============================

-=> Double clicking on "Purge" in the options dialog allows you to purge all
the images except the first one.

-=> A feature "Image = Screen" fuses the screen into an actual image. This
makes any warping or filtering permanent so you can do other alterations of
the image. By making the screen an image, you can now save the screen as a
GIF by using "As Original" when you save it.

-=> The Warp feature was added. Two warping effects can be combined: bulge
(stretching) and ripple (shifting). Bulge zooms the scan line outward or
inward, causing the stretching effect. This can be applied anywhere on the
image (to the scan lines) and can be set to any size. Ripple is merely a
shifting of the scan lines a certain amount (horizontally). Warping only
effects the displayed image, not the original image. You must use "Image =
Screen" to make it permanent. You can then rotate the image 90 degrees to
apply warping on the vertical axis, use "Image = Screen" again, and then
rotate it 90 degrees back for example.

-=> Unregistered versions now can use filtering, but every eighth line is
blank. This is the same for warping.

-=> The Display Screen Popup Menu was changed slightly to accommodate more
entries.

-=> CONTROL-F toggles filtering in the Display Screen.

-=> Rotations are FASTER!

-=> The name of the current file being processed appears at the top of the
screen during loading and color reduction.

-=> TONS OF BUGS FIXED!!!

-=> A bunch of other stuff I can't remember.

Changes in version 3.5 from 3.3
===============================

-=> SOL now starts out with the Options Dialog (unless starting in GEM mode)
so that you can change the settings before loading an image if you want. I
found this to be better especially when loading JPEG images because I
usually want to set the truecolor loading preferences before loading, but in
earlier versions, I had to load a junk image first just to get to the
preferences.
```

-=> Truecolor conversion now can use Octree colormap quantization to reduce to 256 colors. You can also dither the image using different patterns including loaded patterns. Inverse colormaps are supported to allow faster mapping both for truecolor quantization and with color filtering. All truecolor octree and color reduction parameters are in the preferences dialog box.

-=> Fixed Palette truecolor loading can also be used with other dithering patterns besides just random dithering. Other fixed palettes are supported with biases toward red, green, or blue, and combinations of red, green, and blue.

-=> A new preference allows you to display the image immediately after loading without going to the Options Dialog or GEM Menu.

-=> You can load multiple files using Selectric fileselector as well as using wildcards [*/?]. Selectric also offers extensions of all the images that SOL can load.

-=> JPEGs with bad data can be loaded with less trouble.

-=> Fixed GIF saving! No more messed up data! Stayed up all night to fix this one! =)

-=> Speed is great! Just compare! A 800 x 600 256 color GIF...

SPEED OF LIGHT 3.5 GEMVIEW 3.00
LOADING/UNCOMPRESSING TIME: 8 sec 11 sec
GIF COMPRESSING/SAVING TIME: 14 sec 1 min 32 sec
FILE SIZE IN BYTES: 98846 100517

This GIF had 115 colors and lots of blank space, only SOL realized that it could save it as a 128 color GIF and saved file space! How about another...768 x 512 256 color GIF

SPEED OF LIGHT 3.5 GEMVIEW 3.00
LOADING/UNCOMPRESSING TIME: 11 sec 15 sec
GIF COMPRESSING/SAVING TIME: 20 sec 1 min 19 sec
FILE SIZE IN BYTES: 334829 334802

These are actual saving and loading times, no lie!

-=> Saving and loading display information in GIF89a images now works correctly.

-=> A "Flat" wave was added in warping to allow discrete shifting of the image in places. Ideal for corrupted JPEGs.

-=> Lots of bugs fixed involving the capture of the image when going from display to dialogs and back.

-=> Zoom Area now centers your zoom on the screen when the area you selected is not the same aspect ratio as the screen.

-=> Colormap Editor was changed a bit:

-=> The palette can now be edited in VDI order as well as Device order.

-=> A new command "Take" works like "Select" except that you choose a pixel from the image and the color you are currently editing will be set to the image's original color at that spot. Confused? Me too...try it!

-=> You can switch to a different image while in the Color Editor.

-=> The unimplemented feature "omit colors" was omitted (ha ha) from the Color Editor. Ho Hum, so not all of my ideas are cool! =)

-=> Filtered Scaling was really worked-over:

-=> Greyscale Filtering is a little faster.

-=> Color Filtering is now almost as fast as Greyscale Filtering by using an inverse colormap. The inverse color map resolution can be changed for fast approximations or accurate renderings. Dithering is also supported with color filtering using true random dithering as well as standard matrix dithering.

-=> Complex color transformations now also work with filtering.
(A previous bug made this look funny.)

-=> The filtered image is much more accurate both in brightness and in position. The pixels in previous version were shifted incorrectly up and to the left.

-=> Up and down scrolling now works with filtering. This was caused because the filtering routine always drew one less scan line than it was supposed to!

-=> New filters were added and two groups were created: Standard and Enhancing filters. Standard filters try to reproduce the original image as closely as they can. Enhancing filters change the image in weird ways, especially when enlarging the image.

-=> Asymmetrical enhancing filters can be flipped, and all filters can be wrapped or faded at the edge of the image.

-=> Filters can be scaled in height as well as width both horizontally and vertically. Scaling in height causes the filter to brighten the resulting image. Scales less than 1 will darken the image. Blurring by scaling the filter horizontally and vertically can often cause the image to darken, so you can compensate for this with height scaling.

-=> When using the "Change Picture [P]" option from the display screen, you can now select the position on the image that you would like to display next. This is done by dragging a small box (representing the display area) to the position you would like to move to. You can also move between small greyscale pictures with the arrow keys as well as the slider bar.

-=> You can now access images 21-30 with ALTERNATE-Function Key, and you can move to the next/previous image with the '[' and ']' keys.

-=> Holding down ALTERNATE in the display screen prevents scrolling when the mouse moves into the scrolling area.

-=> Scrolling right and left now has less "annoying flickering" in 256 colors.

-=> "Image = Screen [X]" feature now supports a "Shrink" option so that it only converts the parts of the screen that are used. It essentially clips the image for you and omits any blank space.

-=> Two new histograms were added: DARKCONT.HST and LITECONT.HST. These are contrast histograms that only apply contrast to either the dark or light intensities in a color plane.

-=> A glossary was included (GLOSSARY.DOC) to explain some of the more complicated image processing terms.

-=> Fixed some Graphics Card bugs.

-=> The E-Z Registration form can now be printed to an ASCII disk file as well as to your printer. A blank file is also included: REGIFORM.TXT

-=> Speed of Light 3.5 may not be put on any magazine cover disks without my prior permission!

-=> More bugs fixed than I can remember! (I really do have a pretty good memory, don't get me wrong!)

1982. Re: Papyrus vs Redacteur - any thoughts

Newsgroup: comp.sys.atari.st
Date: 1994-08-10 02:34:48 UTC
From: rengbers@netcom.com
Message-ID: <rengbersCuAsI1.BGo@netcom.com>
Source record: 182420

Dear Christian Nieber (chris@buran.fb10.tu-berlin.de) -

Reading over your message comparing NVDI to SpeedoGDOS, it left me with lots of questions and comments that I want to bring up. I quote your original message...

: I am beta tester of NVDI 3, and I just got one of the Speedo 5
: were sold at this UK show.

The current version, 5.0b, outputs text faster than 5.0a (which you saw/used at the UK show). Unfortunately, this means your numbers are obsolete.

: This is a speed comparison of Speedo 4.2, Speedo 5 beta 30.7.94 (sic!
: that's what the boot message says) and NVDI 3 beta 6.8.94.

Ooops! I spoke too soon... apparently, you used an even earlier version. My point is the same.

: All tests are taken on a TT 4+4 on a big mono screen with MagiC 2.0. For
: for Speedo 5 I had to use TOS 3.06 since it kept reporting internal scaler
: errors and crashing in MagiC (same with MultiTOS, BTW)

Running one under MagiC and not the other throws the comparison out the window because of the vastly superior disk routines used in MagiC. The current version of SpeedoGDOS (5.0b) runs fine under MagiC.

: There are two things that affect performance:
: 1) output of already cached characters to the screen
: 2) rendering, creating bitmaps for the cache from the vector information

More than that, really. Specifically, cache sizes. You didn't specify what cache sizes were used, but it should be optimum for each program, respectively. SpeedoGDOS 5 wants a larger cache than SpeedoGDOS 4; I don't know what NVDI wants, but tests should be done on each one to make sure you're getting the best performance out of each. Which brings me to a question - how does Papyrus do its own caching? Does it circumvent the SpeedoGDOS cache or something? Your message reads like there's no difference in scrolling speed between SpeedoGDOS and NVDI if you use Papyrus exclusively, and that isn't really the case, is it?

And why didn't you test more than one application? You critized my statement that SpeedoGDOS 5 was approx. 600% faster than version 4. Actually, I scrolled a long Atari Works document with lots of different fonts and lots of graphics, and I recorded a 650% speed increase.

Also, were both SpeedoGDOS and NVDI running in ST or TT RAM? And is NVDI initializing fonts at bootup, and if so, was SpeedoGDOS set up the same

way? If they weren't the same in this matter, I would expect substantial differences.

Another thing is that you wrote only of text output, and it's incomplete since SpeedoGDOS handles more than text. You stated that you did scrolling tests with Speedo fonts, and some with TrueType fonts... if you're testing scrolling speed, a rather limited example of what these programs are capable of, why didn't you scroll through a document with lots of different fonts, in different formats, and with lots of graphics? Why didn't you use different programs in different video modes? (If you had, I think it would have affected your "NVDI IS GOD" argument).

I could think of a couple dozen ways to measure performance, and you measured one and jumped to conclusions. Interesting. How about booting; launching programs; initializing fonts; changing fonts and sizes; loading, scaling, and displaying graphics; printing text; printing graphics (b/w and color). Of all the things you could chose to compare, you picked one of the less important, I think (not to undermine the importance of display speed when scrolling a text-only document).

Comparing programs and announcing your results is not a trivial matter. If nothing else, be fair and complete. You were neither.

: I don't have any Postscript types for testing, but someone who tried
: it told me they are even slower than TrueTypes.

Doesn't matter. SpeedoGDOS handles Type 1s, NVDI doesn't. That's all that needs to be said (with regard to comparison).

Type 1s are slower than TrueTypes; that's part of the font format and there is nothing SpeedoGDOS can do about it. Windows (and Macs and other systems that support both) scale TrueTypes faster than Type 1s. On the other hand, many professionals argue that Type 1s are a superior format. Take your pick, I suppose (as long as your scaler supports Type 1, that is).

: > SpeedoGDOS 5 has new output routines, and will actually work with
: > NVDI if it's installed, throughput is up to 600% faster than SpeedoGDOS
: > 4.x.

: Strange that I didn't notice anything of that... Or maybe these 600% are
: for the "set squiggling level" call ;-)

No, it's just that you didn't test graphics performance.

: Wilfried Behne says there is no conceivable way how Speedo could "work
: with" NVDI, except by using the standard copy raster calls etc. But this
: does not significantly affect the performance of text output.

Wilfried has spoken with one of our programmers, and I'm told he understands now. The performance gain is not with text, it's with graphics. For example, having SpeedoGDOS 5 and NVDI installed together delivers faster beziers than NVDI alone.

: My estimate is that NVDI 3 will be the standard, since
: - many people already have one and only have to upgrade
: - former versions are known as extremely reliable and compatible, whereas
: this is not exactly true for former Speedo versions
: - NVDI 3 is much faster

I respectfully disagree. Point by point -

- of course many people already have both and would want to upgrade only one, that goes both ways. The question is, which upgrade (SpeedoGDOS or NVDI) gets you more capabilities and performance, given that you already have both on your system?

- it's totally unfair (and not particularly bright) for you to base your evaluation of SpeedoGDOS 5 on earlier versions. We're a different company with different ideas about 'high performance.' Would you like someone saying Papyrus 3.5 is lousy because version 1.0 was? And what if you had nothing to do with 1.0?! I also wonder, why do you so dislike SpeedoGDOS, given that you support it in your word processor, and have even sold it in the past? Did you tell people your opinion when you were taking their money?

- Is NVDI faster? Your comparision was incomplete and inconclusive. Besides, you're trying to oversimplify the issue; I've seen lots of very fast software that is either buggy or just plain unusable. With all due respect, we need to wait until NVDI 3 is released and compare current versions at that time. Again, I mean no disrespect, but I would prefer to hear comparisons from users, rather than a competitor.

I look forward to such comparisons, but let's not waste these good folks' time (or irreverantly and baselessly slam a competitor's product).

: /---\

Ever heard of viruses overwriting the bootsectors of commercial games?

I've had at least 1 disk destroyed by the "bielstein" virus in this fashion, thankfully a friend also had the game so I just copied it back onto my version...

I've yet to come across, or hear from someone that's come across a link virus!

The Suburban Chicago ATarians (SCAT) user group will hold its August meeting on Tues. Aug. 16 at 7:30 PM (7PM setup), at the College of DuPage, Room K157 (the K building is located on 22nd St. just west of Lambert Rd., in Glen Ellyn). The scheduled demos are: 8-bit: SynFile; ST/TT/Falcon: Tentatively, CD-ROM on a Falcon.

Everyone is welcome to attend.

For more information, send me E-Mail at one of the addresses below, or call SCAT's Graceland North BBS at (708) 545-2554 and leave Mark Biallas or me a message. [If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work (at all sites) now. Say, if you're travelling to the Chicago area and will be free that evening, feel free to stop by!]

Yes, but you have to have a postscript device to output to. You could use Ghostscript to preview the generated output file, but you can't preview to the screen directly (at least you couldn't at the time when I gave the ST to my parents :-). TeX does not process the .eps files, but simply places them on the page and sends them to the postscript device.

Have you not heared about write protecting floppies, you can't get a virus
on a write protected floppy disk...!!!

If you change any byte in a floppy boot sector the bootable boot sector
becomes inactive, all active boot sectors have a branch instruction
as the first byte, a 61, you just change this to a 00, the boot sector
them becomes inactive, its that simple, it can't be fooled by any virus
on this earth..

So what people have been posting here about viruses is all hype and full
of rubish...

Your message was mis-directed as was the content of the message! I said that I was NOT opposed to people profiting from their hard work. I said my problem came when people created programs that either didn't work properly on not at all until you sent them money.

Further, I said what was wrong with creating a bare bones demo of a program and then when they register they could have the full featured version.

Next time you choose to flame somebnody make sure you read the WHOLE message!

Laurenz Pruessner (spoil@cs.tu-berlin.de) wrote:
: : 3. With regard to crashing on some encoding schemes, it was a bug that
: : was fixed before SpeedoGDOS 5 was officially released (the version at last
: : week's UK shows was one version prior to that). Our customers won't have
: : that problem.

: Well, maybe your customers won't.
: But yesterday a programmer in the german Mausnet allready complained that
: he received tons of bug reports from customers that did indeed have problems
: with the new SpeedoGDOS and thought he was to blame which he denied he was.

: And after what I've seen I'm well willing to believe him.

And the point is.... ?

Do you have something against COMPO or SpeedoGDOS?

Your post could not be more vague, and I'm not sure if you really expect
a response. "An unknown programmer has received an unknown number of unknown
bug reports..." Well, if he says he isn't responsible, I'd tend to believe
him given that I have no evidence to the contrary. So where does that
leave us?

It's very important to all of us at COMPO that our software does what we
say it will, and that it does it well. If we hear of a bug, it's our
responsibility to fix it quickly. We have seen no bug reports in
this group. If and when a bug report appears, I assure you that we'll
make it utmost priority to see that it is fixed.

I assume that you haven't purchased a copy of SpeedoGDOS 5, so why do you
insist on slamming it without base or reason?

Of course, if you think you know of a bug, we'd love to hear about it so
we can fix it. We've put a lot of time and energy into SpeedoGDOS 5; many
users are excited about this revolutionary technology, as are we, and
it's important that all of our customers are satisfied (can you name
another type manager - for any computer or OS - that supports all the
major font formats as well as platform-specific font formats?).

We are committed to our customers and the software products we produce.
It's great to have real information posted here for the benefit of all,
so please share it when you can. And if you have a legitimate complaint
or problem with SpeedoGDOS 5, I urge you to contact your nearest COMPO
Software office so we can remedy the situation. I believe that, in your
case, that would be in Aachen, and they're on 0241-83098.

: GDOSs, will bomb out when using Speedo 5.

: A couple of people have already told me that Speedo 5 is incompatible
: with a couple of programs which worked fine with other GDOSs.

: Any ideas anyone?

SpeedoGDOS 5 is 100% compatible with applications that use GDOS. Although we at COMPO developed SpeedoGDOS 5 where Atari developed previous versions, SpeedoGDOS 5 is a continuation of GDOS rather than a wholly new version (however, version 5 is the greatest and largest upgrade GDOS has ever seen).

We went to great lengths to ensure that nothing was changed affecting compatibility, and we know of no GDOS-aware programs that have any problems with SpeedoGDOS 5 or its new features. The addition of PostScript Type 1 and TrueType fonts, as well as the performance enhancements, are completely transparent to GDOS-aware programs.

Hi all,

I have I "small' problem. The other night I was running a defragger (tool19) on partition 'G' of my hard drive. It found a few 'unlinked' clusters and I replied yes to restoring them. So far nothing unussuall, I did this MANY times. The problem was when Iwanted to defrag the files and 'move' directories. all of a sudden the 'directory not found' error box came out, and a crash followed. Upon reseting the computer ICD driver fails to acknowledge I have a 'G' partition.
So, is there something I can do to recover my data. It would be really bad if I lost it all, as I didn't backup for a while.(yeah, I know, it serves me right)

I would like FTP able software, as I am pressed for time, but commercial stuff is OK too, as long as I can get it shipped to Japan VERY FAST.

Thanks in advance.

PS: The drive is a 240Meg Maxtor, and 'G' is a 100 meg BGM partition.

1997. Re: Atari ST comm programs?

: Hi a friend of mine has on Atari ST and is looking at getting on the
: internet. However he doesn't how a comm program, getting an ext modem is easy
: , but the software isn't. Is there an FTP site for Atari ST programs? Also
: is there a really good comm program, thats easy for a beginner to use? If you
: could e-mail me that would be great as I'm not always able to read this group.

: Freeze Dried Terminal is highly recommended, but it does not have VT100
: emulation. You can use ansi or some sites will allow VT52. I also suggest
: with FZDT, that the news reader of choice to use is tin, cos nn does not
: seem to agree with FZDT's capture buffer. Apart from those 2 minor things
: I have no problems, I also have Stalker, Connect, Flash 1 & 2, and a few
: other piddly programs, but FZDT is far and away the quickest to get around
: and its screen redraws etc leave the others for dead (and STalker is a
: commercial program, supposedly the best, but I reckon I wasted my money
: on that one 8-( ). You should be able to d/l FZDT from
: 128.252.135.4 /mirrors/archive.umich.edu/atari/ it should be
: in the comms area the program is at version 2.20 and is shareware.
: If your friend likes it and wants to register it, then tell him to
: register it with BEN VAN BOKKEM (address in readme file or manual) in
: England, not with the author AARON HOPKINS in the usa (he is hopeless).
: Ben has his own BBS (called INTERNET BBS funnily enuf) and upon receipt
: of the shareware fee, he will leave the software key in an area for you
: to d/l, it only takes about 2 secs (10K i think). Email me if you
: have any other querys about FZDT. 8-)

>>someone than has both working together send me their config files?
>>(assign.sys and any tips you have for fixing the problem?) thanks a lot

Oops--something screwed up--I'll try again. What I did was load all my Speedo fonts and drivers into my GEMSYS folder, where NVDI automatically put its files during the installation. Then I edited the path in the assign.sys file to the GEMSYS folder---also in the extend.sys file. It's essential that NVDI loads before other drivers from the AUTO folder--I put it second after XBOOT. (I'm using MAG!X and an ST). I hope this helps.

1999. Some STuff or sale some wanted.

OK I am clearing out some of my ST stuff to make way for some new items.

FOR SALE

Hard Drive : Seagate ST-138N 25Meg MFM drive 3.5 inch half height.
This or the controller is broken. Lets say $15 (for
controller or drive your gamble) or $25 for both.
Hard Drive : Fujitsu M2611S 45Meg SCSI drive. This is a nice
3.5 inch third height drive. Works great replaced the
above setup lets say $50
Hard Drive : Quantum Prodive 105S 105Meg SCSI. I purchased this
to replace the above when I ran out of room since I was
told that it sometimes sticks at powerup (athough I never
noticed the problem) Lets call this $50 also.

3D Glasses : A set of Stereo Tek 3D glasses (these are LCD shutter glasses)
complete with case, cartridge and software I can't find the
small manual that came with them (all important docs are on
the disk) . I will through in my copy of degas elite the
recomended package for generating 3D pics. I even have the
manual for this! Say $35

Software : Word Perfect $30
Mark Williams C $30
Cad 3D 2.0 & Cybermate $25

Games : Zak McMrackken $15
Uninvited $15
Bards Tale $15
Indy ... Last Crusade $15
Dungeon Master $10
$45 for all of them

Disks Only : Kings Quest III $10
Better Dead Than Alien $ 5
Gauntlet $ 5

You can have all the software for $95 or exchange for Atari Works.

Terms are all prices plus shipping, I live in the bay area if you are
local you can pick the stuff up if you prefer.

THINGS WANTED

I will part ex the above or buy any of the following I only use my
Atari or Serious stuff now :)

Atari Works
Calamus Fonts and modules
SCSI tape drive
RSVE hardware board
ICD pro utils
NVDI
Moniterm (or other) graphics card for Mega ST.

> I wasn't stating that you should give the whole thing away. I agree with
> you, there are a lot of people who think why pay for it once you got it.
> But don't you want to make sure the car is running before you buy it?

That isn't as much of a concern if what has been disabled leaves little doubt that it does function. For example, disabling a save feature; why is there a reason to doubt that it may not work if you register it? By your logic, a playable demo of a commercial game, for example, would not convince you to buy because if it only gives you one level to play, what is there to tell you that the rest are functional? I don't think that it is appropriate or practical to demand such guarantees of an author if it requires that he prove to you beyond a shadow of a doubt that _everything_ works. Some things you just have to put your faith in and hope that it does -- and if it does not, you can inform the author of such. However the chances of those features that have been disabled or removed until registered NOT working are very slim -- and the author mustn't have been paying very close attention, too.

> I think what people need to develope is a program that will delete it self
> after say 30 days is up, unless you enter the key.

THat would necessitate having an internal clock, which not everyone (not many that I know of) has. And anyway, anyone can cheat such a restriction by changing the date. No help there.

Hi Otto

See if you can find a copy of Speed of Light which loads JPEG, GIF,
IMG and others.
It's shareware, allows more than one pic to reside in memory at the
same time (up to 4) though this will probably depend on the amount
of memory you have and allows manipulation of colour, etc..
Not too much is crippled in the demo version and it works very well
for me. I have version 3.1

2003. Re: SpeedoGDOS 5 & NVDI 3

Newsgroup: comp.sys.atari.st
Date: 1994-08-10 08:47:10 UTC
From: spoil@cs.tu-berlin.de
Message-ID: <32a46e$mhr@news.cs.tu-berlin.de>
Source record: 182450

Robert Engberson (rengbers@netcom.com) wrote:
: Do you have something against COMPO or SpeedoGDOS?

Absolutely not. In fact, I was one of the programmers who insisted on further development of SpeedoGDOS when Atari thought other things were more important. So I think I don't make much of a mistake if I say that I was one of the reasons why there is a SpeedoGDOS 4.2.

And when it comes to COMPO: I'm one of the authors of Overlay, that COMPO distributes, so why should I have anything against COMPO?

But what I've got something against is if a company publishes something that is of vital importance to the stability of the whole system that obviously hasn't been tested very thoroughly. I had the same opposition against KAOS that I do have now against SpeedoGDOS 5.0.
I certainly know how easy it is to make a mistake when programming.
The difference between a bug in a text editor and one in a part of the operating system is: when the editor crashes, you can still say "shit", call the manufacturer and use another editor in the meantime.
If a part of the OS misbehaves, anything can happen.

: Your post could not be more vague, and I'm not sure if you really expect
: a response. "An unknown programmer has received an unknown number of unknown
: bug reports..."

Well I can give you more precise data if you really demand it: the Author of the bug report was Ulrich Rossgoderer, one of the "Kandinsky" people, so you won't say that this is one who doesn't know what he's saying.
His bug report features things that I haven't seen yet. What I've seen was a crashing scaler and problems whenever using text attributes on non-Speedo-fonts. What he's seen are problems using "v_bez"in files like COLUMBIA.BEZ, system halts whenever META.SYS is kept residently in RAM, and a faulty DRIVERS.PRG that removes printers from the ASSIGN.SYS file.

: It's very important to all of us at COMPO that our software does what we
: say it will, and that it does it well. If we hear of a bug, it's our
: responsibility to fix it quickly. We have seen no bug reports in
: this group. If and when a bug report appears, I assure you that we'll
: make it utmost priority to see that it is fixed.

I'd prefer a proper beta-testing. That is expensive, but it would save you, me, and tons of users and developers nerves.

|> Ghostscript to preview the generated output file, but you can't preview to the
|> screen directly (at least you couldn't at the time when I gave the ST to my
|> parents :-). TeX does not process the .eps files, but simply places them on the
|> page and sends them to the postscript device.
|>
Or you can convert the entire TeX output into postscript using dvips by
radical eye software which will also include the eps files into its
output postscript file. That is my preferred way to do it.
The actual inclusion into the TeX document works much like this:
include the style epsf.sty into the document,

and then do

```
\begin{figure}
\begin{center}
\leavevmode
\epsfbox{file.eps}
\end{center}
...
\end{figure}
```

Hope that helps,
Ulrich

2005. Synths and Other E-Music Gear For Sale

All,

I had the same problem unzipping the Cain Newsletters. I loaded the zip file into Edhack and deleted the garbage in the file up to the part that is the start of the actual zip. All zips start with two bytes "PK" (ignore the quotes). Just delete all the junk up to the "PK" characters and save it.

It seems to have some header on the front of it.

>I remember you saying similar things about GSZRZ, saying that it required a
>shell or something. Suddenly I see you recommending GSZRZ. The program
>hasn't changed, what happened?

I have a TVM Multisync a SM125 and a UK Fidelity monitor CM14 that I found
in a museum, but that does not like 60hz...

GSZRZ still requires a shell to run with Flash 1.6, I am going
to try and program one myself..

You can't run GSZRZ with out a shell and do ARGV, this is needed to upload
multible files, the command line is only 125/127 characters long, that would
not support many files with there paths..?

Also I would be abel to select my upload/dnload option, with out a shell
it can be a bit of a problem, like turn on resume mode, 16 bit crc's,
Esc commands, Ymodem/G, these are commands that I use and need, so Please
some one tell me how this can be done easly with out a shell...

GSZRZ is the best Zmodem there is for all Ataries, and does Ymodem/G,
and supports all the comms port and the midi one, what other protocol
program does that..??...

Some terminal programs do support GSZRZ, like Rufus, Trapido and Connect, so
they don't need a shell, but all other programs do....

Macintosh files contain a header that among other things tells the OS which
application created the file(a slightly refined version of the 'Install
Application'-functionality as found on Ataris). Surely(? :-) it's this header
that's causing the problem.

I found the following in 'alt.sounds.binaries.midi'...

>The Macintosh header (containing name, file type, etc.) is confusing your
>IBM system... you have to strip it by turning off MacBinary (or macbinary II)
>in the term program you send with, or the Zip program you use (on the mac)
>Failing this, I think you can manually strip out the header from the beginning
>of the file. I'm pretty sure it's 128 bytes (could be 64).
>
>You can transfer on disks alright because the file exchanging software
>(apple file exchange, Mac PC Exchange, Access PC, etc.) strips the header
>for you, as well as Macintosh resources (usually)
>
>Hope that helped...

Hopefully this will solve the problem.

There already is something similar to this concept. My cable company
is adding/has added a SEGA channel. You get a special cartrige that
plugs into your SEGA Genesis, and can download games off of the cable
system. Cost is $20/month. I think the blurb they sent me in the mail
about it said that they have 50 games a day.

No, it's not called Power Up...it's called Power Up 2.

System Solutions have another product called Power Up...which is a slight modification for the Desktopper, seperate case and keyboard for the Atari range. What poer up does it to bring the reset, and on/off switches to the front of the case.

PowerUp 2 doubles the clock speed of the 68030 in the Falcon, and some other things. However, it is still not twice as fast as 16 Mhz, due to the problem with RAM speeds. You will need something like TT RAM to speed it up...and so a board that will allow you to take TT RAM...

However, I am getting Power UP 2 for the Falcon at work...as it does make a difference...only 60 pounds too...including fitting...100 pounds.

From: em09@liverpool.ac.uk
Message-ID: <CuBMyo.AuI@liverpool.ac.uk>
Source record: 182271

Please can anybody help me?

I have just bought a SupraDrive 30Mb hard disk for my STE but the guy who sold it to me did not have the manuals and, worse, some of the utility files on the disk are corrupt :-(

I have replaced the drive with a 45Mb one but I am not able to make it autoboot until I can get fresh copies of two of the programs and their resource files. They are;

SUPRMOD.PRG + SUPRMOD.RSC
and SUPUTIL.PRG + SUPUTIL.RSC

If anyone is able and willing to help, I can arrange for an ftp transfer. Please email me if you have a SupraDrive and a kind heart.

John.

>BTW: as far as I know the current PowerMac ROMs emulate a 68020, running
>at approximately the speed of a 25 MHz 68030 processor.

Actually that is correct, it does emulate a 68020, not a 68040, but that's just a function of Apple's "680x0 emulation software". Someone could, for example, emulate a 68030 as well if they wished (a 486 software emulator is on the horrizon already). Apple has, however, doubled the speed of their emulation software, which should be released sometime this winter, to make it about the speed of a 25mhz 68040 (running on an 80mhz ppc I believe). Since the PPC chip should be able to to 100mhz at some point, that would be one hell of a fast Atari, even though it would be emulated.

Just a note for anyone seriously considering working on an Atari emulator for the Mac; Every person I know that used to be an Atarian moved to the MAC platform, not the PC platform. I'm sure this is not true for everyone, but it certainly is true among my old group of Atari-friends, so hopefully there would be a market of sorts for this product...

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's 'Statistics of Deadly Quarrels'. You've probably never heard of it even though its relevance to the mess you're in is at least as great as that of Darwin's 'On the Origin of Species,' which you learned about in fourth grade. And that's because it's so completely terrifying only those 'experts' who are adequately armoured with preconceived contrary ideas which will enable them to disregard Richardson's work completely ever get to study it."

2014. Q: Monitors for both b/w and color?

Newsgroup: comp.sys.atari.st
Date: 1994-08-10 14:27:31 UTC
From: oberle@informatik.uni-koblenz.de
Message-ID: <32ao4j$jut@newshost.uni-koblenz.de>
Source record: 182433

Hi all,

does anyone know a monitor which is able to display all
the "old ST resolutions", i.e. 320x200, 640x200, 640x400?
I only know the old NEC multisync 3D which can handle the
low horizontal frequency of the color resolutions. Is there
any other comparable product?

Thanks,

Christoph

I too was an Atari enthusiast turned Mac eventually... I would kill for
an Atari ST emulator on the Powermac... It is the perfect platform for
such emulations. Someone listeniong? Enough with the Timex Sinclair and
Apple II ems... let's see an Atari ST emulator. =)

2016. Minix programming.

Newsgroup: comp.sys.atari.st

Hello there!

I have installed MiNT (without multitos interface) and the Minix
file system driver v0.60 on my Falcon and am curious about how to
programming my software that it supports the extended filenames.

Can anyone make me happy with an "Easy" source code of it how to
get a list with files (long filenames), changing attributes and
other functions they they are needed?

I don't have ftp access, when possible uu-encoded (msgs not larger
as 30 Kb) using email.

Thank you for help!

Greetings from The Netherlands,
Koos

2019. MIDI-COM Demo & MiNT 1.10h7

Newsgroup: comp.sys.atari.st
Date: 1994-08-10 17:07:08 UTC
From: dbrewood@nest.demon.co.uk
Message-ID: <940810Z170708.205dbrewood@nest.demon.co.uk>
Source record: 182322

Can anyone advise how to get MIDI-COM working along with MiNT 1.10h7? I've copied the .XFS driver into C:\MULTITOS\ and have installed both AUTO progs correctly. All seems fine until I try to access the other system on the Mega ST4 from the Falcon, I double click on drive N: (hard coded in the .XFS file) and get a busy bee from there the system and then everything locks solid.

Any ideas anyone? This is installing a link via MIDI.

The Acer 7015 MultiSync monitor supports all the old ST resolutions
just fine. I don't know if any of their newer models would also
or not. You just need to check their horizontal and vertical
ranges to see if they can handle it. Wayne

Yes, you will no longer be able to save configurations, and I think uploads
or downloads will be restricted to some degree (not sure).

> The one thing wrong with this type of shareware
> scheme, though, Matt, is that people could just keep reinstalling
> the program before the time runs out....

Not with CoNnect. It is smarter than that.

That said, CoNnect is a steal at $50.00US, IMHO. It is the best telecomm
program for owners of 16mHz or above Atari computers, again IMHO. For 8mHz
users, the additional speed one can get from other telecomm programs might
outweigh CoNnect's list of features. Just my $0.02.

ST Format coverdisk programs are often not distributable via PD/Shareware
channels. However, purchasing the back issue should only cost you $10-$15,
and you will have the docs in the magazine itself (usually quite brief, but
with an opportunity to purchase the complete docs for an additional fee).
Thus, you probably want to find out the exact issue that this program appeared
in.

Strange, i have NVDI 2.5 and it works quite nice with SpeedoGDOS.
Have you checked the order in your Auto folder ?
They have to be installed in a specific order, but I cannot remember which.
Anyway this is explained in one of the readme files on the original disk.
Try reordering your AUTO folder.
Also, you might try to disable GDOS in the NVDI program (with
nvdidflt.prg), then use nvdiconf.cpx/acc to enable it from the desktop if
you are not running with SPEEDO.

kR> : Also, can anyone tell me how to install a new system font with NVDI? Ev
kR> : time I cange the assign.sys file from the regular font it ignores my

kR> Have no clue. always used the normal system font.

This might not work if you have SPEEDO installed AND use the new AES (4.1)
Generally, you only have to put 'S' in front of the fontname in the
assign.sys for this to work - but I guess you knew that...

2030. Including PostScript in TEX (was TEX)

Newsgroup: comp.sys.atari.st
Date: 1994-08-10 19:59:26 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <32bbiu$t15@geraldo.cc.utexas.edu>
Source record: 182353

Hi,

>> Can i import .ps/.eps files into a TeX document?

The short (and inaccurate) answer is YES. The correct answer (the one that needs to be understood) is a little more complicated, and some tools external to TeX are required. In fact, it was entirely for the purpose of including PS in TeX documents that I did Atari ports of dvips and Ghostscript. See the comments below if you want a more complete explanation.

You cannot actually include PostScript in the .dvi file created by TeX. What you can do, however, is use the TeX \special command to include instructions in the .dvi file to a dvi->ps converter program. Then, a program like dvips can include the proper PS files while doing the conversion from the dvi format to PostScript.

The process goes something like this:

1.) InputFile.tex contains TeX source code, including an appropriate \special command where the PostScript graphics (say, "graphics.ps") are to appear. The exact syntax of the \special command depends on which dvi->ps converter you wish to use. Read the instructions for dvips (or whatever) for the proper way to use the \special command.

2.) Running TeX on InputFile.tex creates InputFile.dvi, which does not include any PostScript from "graphic.ps". It does contain, however, instructions which can be understood by a dvi->ps converter, like dvips. Those instructions say that "graphic.ps" should be included at some specified point when the dvi file is converted to PostScript.

If you try to view the dvi file with a previewer, you will generally see a blank space where the image was supposed to appear. This is because the dvi file contains none of the image information. Some dvi previewers, can understand \special instructions to include bitmapped images when the dvi file is being displayed, but this is another topic. Even in this case, however, the bitmap information is not contained in the dvi file itself. It is the previewer that reads the image and places it in the previewer output. There are no dvi previewers that can display included PostScript.

3.) Processing InputFile.dvi with dvips (or some other dvi->ps converter) converts the dvi file to PostScript, and includes the PostScript code from the file "graphic.ps". The resulting PS file can then be sent to a PS printer or, using ghostscript, displayed on the Atari screen (windows or not -- your choice) or converted to another printer format (like HPs PCL for DeskJets and LaserJets).

While all this may all seem a little complicated, operationally it is not too bad once you have InputFile.tex properly created:

```
tex InputFile
dvips InputFile
gs InputFile.ps
```

Of course, you have to have dvips and Ghostscript properly installed, and this is not always trivial. There are also some peripheral issues that are important if you want high-quality output, but I won't get into those here.

Both Ghostscript 2.61 and dvips are available from atari.archive. I currently have a partially working port of GS 3.0, and will upload a beta version to the net when I get the remainder working.

] Does anyone know the current status of:
]
] NeoDesk 4

Apparently shipping in small quantities, should be full-go in about 3
weeks for all of the pre-orders to be satisfied.

] Spectre 3.1

Been "Ready" for about 6 months, been "planned" for about 3 years. Probably
won't come out before mid-1995 if ever.

] Speedo 5

Semi-available.

] NVDI 3

Give it another month.

You could search for an (used) Eizo (sometimes called Nanao) monitor type
8060S which served my ST/MegaSTE and now TT very well, it can handle all ST
resolutions and you can use it as a (S)VGA monitor on a PC.
Scanrates go from 15 kHz to 35 kHz Horizontal and 50 Hz to 80 Hz Vertical.

You definitely need to get Speed of Light 3.5. It's on ftp
atari.archive.umich.edu or mail be and I can uuencode it to you.
It is the fastest GIF and JPEG viewer for plain ST's and is
great on memory! If you think I'm biased because I'm the author
(don't bother posting, people) then see it for yourself and make

Hi Robert Engberson (rengbers@netcom.com):

> The current version, 5.0b, outputs text faster than 5.0a (which you
> saw/used at the UK show). Unfortunately, this means your numbers are
> obsolete.

NVDI 3 is also preliminary. But OK, we'll re-compare in two weeks
when both products have advanced.

> Running one under MagiC and not the other throws the comparison out the
> window because of the vastly superior disk routines used in MagiC. The
> current version of SpeedoGDOS (5.0b) runs fine under MagiC.

The Speedo 5 version doesn't run with MagiC, and the NVDI 3 beta I have
doesn't run on TOS (The Behne brothers do this only for safety in the
beta versions, they could always make one that runs everywhere, of
course)

But for comparison I tried again for NVDI 2.5 + Speedo 4.2 MagiC 2.0
TOS 3.06
Test #1 33 sec 32 sec
Test #2 15 sec 13 sec

So TOS is even a little faster. Don't ask my why, may have to do with
Gemini or the ACC's I have installed. So the numbers should even have
been a little in favour of Speedo 5.

> More than that, really. Specifically, cache sizes. You didn't specify
> what cache sizes were used, but it should be optimum for each program,
> respectively. [...]

It's 100 kB character + 100 misc for Speedo 5, 136 kB altogether for NVDI
3. But I chose the tests so that cache size shouldn't make any difference,
because in test #1 all characters are in the cache and in test #2 no
characters are in the cache.

> how does Papyrus do its own caching? Does it circumvent the
> SpeedoGDOS cache or something?

By getting the character bitmaps via v_get_bitmap_info() and building
up every line of text in a buffer by optimized routines. All very legal.

> Your message reads like there's no
> difference in scrolling speed between SpeedoGDOS and NVDI if you use
> Papyrus exclusively, and that isn't really the case, is it?

Indeed, there is no speed difference between the different font systems for
characters already cached by papyrus. I turned off papyrus' caching for the

other measurements.

> And why didn't you test more than one application? You criticized my
> statement that SpeedoGDOS 5 was approx. 600% faster than version 4.
> Actually, I scrolled a long Atari Works document with lots of different >
fonts and lots of graphics, and I recorded a 650% speed increase.

I don't have Atari Works installed, but it couldn't do much else than
do v_ftext() and similar text output calls. The test essentially measured
the performance of these calls (to avoid misunderstandings I leafed page by
page, so there's no relevant raster copy time in the measurements). Since
you ask for irrelevant details of my configuration, I have to ask you to be
more specific with which configurations you got these results.

> Also, were both SpeedoGDOS and NVDI running in ST or TT RAM? And is NVDI
> initializing fonts at bootup, and if so, was SpeedoGDOS set up the same
> way?

Both have all the fast ram bits set, and they have the same set of fonts
(the 14 standard speedo fonts + 6 Truetypes)

> why didn't you scroll through a document with lots
> of different fonts, in different formats, and with lots of graphics?

The results would have been less reproducible. Graphics speed is tricky
because bezier curves can be sped up a lot by giving up smoothness. Maybe
someone should write a new benchmark program. Anyway text output is the
most important factor of VDI speed for most users IMO.

> Comparing programs and announcing your results is not a trivial matter.
> If nothing else, be fair and complete. You were neither.

I tested the most important VDI speed factor in the configuration I use
most, and specified exactly what was used.
So what about this 600% Speedo 4/Speedo 5 comparison?

> Doesn't matter. SpeedoGDOS handles Type 1s, NVDI doesn't. That's all that
> needs to be said (with regard to comparison).

Admittedly, that's a point for DTP professionals who don't mind spending
much money for fonts. But don't DTP professionals use Calamus or Didot?
Truetype fonts are cheaper and more widely available, and the average user
cares more for value for money than for typographical perfection. Of course
quality fonts are also available in Truetype format (the same fonts are
often published in different formats) if you spend the money. That's why
the Behne brothers decided against Postscript fonts. After all the
Postscript scaler permanently needs some memory and increases the price by
the licence fees.

> - it's totally unfair (and not particularly bright) for you to base your
> evaluation of SpeedoGDOS 5 on earlier versions. We're a different company
> with different ideas about 'high performance.' Would you like someone
saying
> Papyrus 3.5 is lousy because version 1.0 was?

I didn't say I base _my_ evaluation of that, I said "My estimate is that NVDI 3 will be the standard, since [...] former versions are known as extremely reliable and compatible, whereas this is not exactly true for former Speedo versions"
I'm afraid that's the way the market works. You buy the name, you get the image of the existing products with it.

And unlike 1st Word plus 4, this isn't so far off the truth this time. My impression is that Speedo 5 inherited much from Speedo 4. For instance I recognised a well known bug: Try displaying an ASCII table of the characters above 128 of the Speedo font "Symbol proportional". It crashes in all known Speedo versions, while it works fine with NVDI 3.

> I also wonder, why do you so dislike SpeedoGDOS, given
> that you support it in your word processor, and have even sold it in the
> past? Did you tell people your opinion when you were taking their money?

In the interest of a well running papyrus+Speedo, we had to sell Speedo 4.2 because Compo Germany was exclusive Speedo distributor in Germany, but they kept distributing 4.11 even half a year after 4.2 was available (this has been discussed in detail in the MAUS net, and since it's only relevant for Germany, I won't go into this here).
Speedo, at least since 4.2, works OK most of the time, but we still get some complaints a week about problems that are known Speedo bugs.
The better is the enemy of the good, as we say here.

> Again, I mean no disrespect, but I would
> prefer to hear comparisons from users, rather than a competitor.

We'll sell both Speedo 5 and NVDI 3. We're only interested in an efficient and stable vector font system. I found it important to inform users about my first impressions. After all we often get the blame from papyrus users if the vector font system makes trouble.

2046. Huge Atari ST lot for sale

Newsgroup: comp.sys.atari.st
Date: 1994-08-11 01:59:17 UTC
From: jrl8@namaste.cc.columbia.edu
Message-ID: <32c0ll$f0h@apakabar.cc.columbia.edu>
Source record: 182376
Cross-posted to: comp.sys.atari.st,ny.forsale,nj.forsale,misc.forsale,misc.forsale.computers.other

I have the following Atari ST equipment for sale. I would like
to sell everything together, but would consider serious offers
to break up the systems.

Atari 1040ST computer system w/mouse (TOS in ROM)
(includes built-in 3.5" drive)
Atari 520ST computer system w/mouse (TOS in ROM), works sometimes

2 Atari SC1224 color monitors
Atari SF314 double sided 3.5" disk drive
Atari SF354 single sided 3.5" disk drive

Supra 30 megabyte fast hard disk with NeoDesk operating system

All power cables, power supplies, and cables are included to
hook up everything.

The following software, all with original disks, boxes, and manuals:
Word Writer 2.0 Timeworks (barely used)
Timeworks Desktop publishing Timeworks (with bound manuals, never used)
Crazy Cars Titus
International Soccer Microdeal
Wizards Crown SSI
Questron II SSI
Heroes of the Lance SSI
SDI Cinemaware Interactive Movie
TetraQuest Microdeal
Prime Time First Row Software
Starglider Rainbird
Starglider II Rainbird
F15 Strike Eagle Microprose
Rings of Zilfin SSI
Speed Buggy Data East
Typhoon Thompson Broderbund
Guild of Thieves Rainbird
Outrun Sega
Captain Blood Mindscape, Inc.
Road Runner Mindscape, Inc.
Road Wars Electronic Arts
Obliterator Psygnosis
Sinbad Cinemaware Interactive Movie
Defender of the Crown Cinemaware Interactive Movie
Pinball Wizard Accolade
Bubble Ghost Accolade
Ultima IV Origin Systems (+ cluebook)

Dungeon Master FTL (no box)
Virus Rainbird (no docs)
Moebius Origin Systems (doesn't work)

The following software has original disks and manuals but no boxes:
Aegis Animator/ST Aegis
Impossible Mission 2 Epyx
ST Basic Atari
Flash Antic Software
Block Out California Dreams
SimCity Maxis
High Roller Mindscape
Time Bandit Michtron
Barbarian Psygnosis
Airball MicroDeal
Airball Construction Set MicroDeal
Skyfox EA
Neochrome Painting Program Atari
UMS Rainbird
ST Wars Miles Computing
Chaos Strikes Back FTL
Swiftar Accustar Software, Inc.

Plus dozens of other games (Rogue, Test Drive, Sundog, etc.) with
just original disks (no box or manuals), plus a TON of shareware
on disks, plus old Atari distribution disks (DB master one, megaroids,
languages, etc), plus an entire collection of START disks representing
about twenty issues.

There are also duplicates of some of the software (Dungeon
Master, Time Bandit, etc).

I am looking for $895 for the entire lot.

Please call or email if interested!

Best regards,
-JRL

What do you mean GEM-View doesn't support JPEG??? Do you have
an old version of GEM-View? Another option is Speed Of Light,
which is now up to v3.5 (look for an archive named SPOFLT35.xxx)
and will use some hardware tricks to display more colors on an
ST.

I believe you COULD as long as you don't include Atari/Brainstorm's
decoder with your software. Then again, they COULD also come after
you for 'reverse-engineering' hooks into the decoder.

Ofir - thanks for replying - and for forwarding my original message to Vic.

Unfortunately, I have no access to .cix here - only to the Usenet. There is a Toronto Freenet being set up and will be running fairly soon, though - is there any way I can contact Vic via the Internet? (I'm hoping to get some training on how to cruise the Internet before that happens).

If not, I guess the old standby - Canada Post - will have to suffice :).

SM> Does anyone know the current status of:
SM>
SM> NeoDesk 4
SM> Spectre 3.1
SM> Speedo 5
SM> NVDI 3

SpeedoGDOS 5 is out now, and available from Compo.

Neodesk 4? It's been a long wait, but according to a message I got from Dan Wilga, it should be shipping pretty soon now - all they were waiting for were the new manuals to show up this week. Rick Flashman should be able to update you on that here. (I've been registered for the upgrade since last February, but I've been willing to wait this long for what is supposed to be a real knock-your-socks-off product from a company that features brains and excellent customer support).

Spectre GCR upgrade? I'm not so sure - but David Small was heard from earlier this year in GEnie's ST online magazine. Seems the big problem was System 7 - according to Dave, it looks like Apple did some special programming in order to make it an "emulator killer". He said, though, that a solution was at hand.....

LOL! Thanks Mark, you made my day on THAT one.

Although the thought of having an important project being interrupted by the image of an obnoxious can of Mott's Clamato is rather chilling :)

(For those who don't understand the last bit - there's an amazing commercial for Mott's Clamato running in Canada that has a computer-animated can of the stuff running amuck in the fridge a la Daffy Duck, trying to get the attention of the guy looking for beverages. At one point it even rips open its label and "flashes" the guy!)

In some cases, if a program is run and it fails the copy protection test
(if a disk is copied but did not reproduce physical copy protection, or
if the wrong password is used), it assumes that a pirating attempt has
occured, and will work to some degree but not completely. For example, the
Falcon flight simulator will work without the correct symbol from the code
wheel that forms the copy protection for the game, but it instantly surrounds
you with super MIG fighters that shoot you down. I know this because it also
does it when you make more than two mistakes with that damn code wheel (but it
does not tell you, grrr). I presume that this is to either provide a bit
of built-in advertising for would-be pirates, or to irritate such folks.
Another example would be Temple of Apshai. If one tries to use the original
disk to save games with (as a buddy of mine once did), it apparently messes up
the copy protection. It shows this by allowing the game to go on for a few
minutes, then showing a picture of a gravestone with the inscription "Software
Pirate, Scum of the Earth".

That said, I think the poster above also meant that additional copies of
a program can be made as desired (or "without limit") if either the physical
copy protection (multiple copies of sectors, intentional bad sectors, etc.)
or manual-type protection (type in the word on page x, etc.) is circumvented,
or "cracked".

Steven Constantine (kaps3@central.susx.ac.uk) wrote:
> Can i import .ps/.eps files into a TeX document?

In general, yes. You can use the "special" command, but a much better method is to use psfig. This is a set of macros for TeX/LaTeX that allows one to easily use .ps/.eps files in TeX (the special command is highly irritating in terms of placment). It should be easy to add to any TeX implementation, as it is just a .sty file that is read in during processing (so you can just add a \input line at the top of your document to load it). Psfig is available via anonymous ftp from lots of places.

Now, I have not played with TeX/LaTeX on the ST, but I presume it is fully functional.

Check out Speed of Light, now up to version 3.5, by Stuart Denman.
I'm sure Stu will jump in at this point and tell you he just placed it
on a.a.u.e for ftp :-)

There is a version 2.50 on genie but I have not been able to get it to work properly. If someone can tell us how to install the darn thing..

I'll see if I can upload the latest file onto one of the atari sites (unless someone else has already done so.)

I personally use PhotoChrome4. It seems faster on my STe.
Also gives more colors than Speed of Light.
It can display RAW, TARGA, IFF, and GIF
images. CAN'T handle JPEG though. Can save as Spectrum
or it's own PCS format. Comes with viewer for PCS files.
Not as versitile as SOL3.5 but better for just viewers.

btw, Has anyone seen a newer version of Photo Chrome?

There should be plenty of older multisync monitors that can to it,
TVM11, Texan, Ezio..?? = Epson brand, Sony, Panasonic....

There are many many more, go have a look at some old mags...

If it can handle CGA/VGA it should work...

Speedo 4.1 definitely *doesn't* like any comments in assign.sys if
NVDI is around. Also, be careful you haven't got a device ID of 10 in
assign.sys, since this also causes grief.

>still my responsibility to look (possibly more closely) before I buy.

Yes, we all have software like this. But then tell me why you did buy it ?
Maybe it was good when you bought. Maybe it's wasn't as good as told, when
you bought it. Some people just see to that they get the right kind of
software, _BEFORE_ buying it. And if this can't be done via mags and dealer,
due to lack of them, they have to find another way to seak their information
and that way is or can be by a pirated version of the software they seak.
Exactly like when you buy a car, or something simular. You don't buy this
because some mag or a dealer tells you it's the best, do you ?

>
>In both cases, if I had simply stolen the software, it _would_ be "counted

>So your claim that "this can't possible [sic] be counted" is incorrect.

I think that depence on what you mean by stolen. Why should you steal a
program you don't need ?

>

My point was more about the need of the software. "using it now and then"
sure can seem as an need, but lets twist it and say, if the person can live
without, cause thats the real need.

>What it boils down to in all these cases for the "pirate" ("har, har,
>me matey's... heroic fellows we are!") is that if you can get away
>with it, it's OK. The rationalizations will follow.

I don't agree, unless we talk about real piracy. (I know some of you might say, there's is no difference. Either you're a pirate or not). But i do believe there is a difference, especially when living in Denmark who has lost almost all their atari users in just a few years. I think the number went from more than 20.000 active users to around 2000 now.

>
>What I prefer to do when pondering questions of right and wrong, is

>that first copy! So there would be no development and distribution
>of such products/services (or only at such a level as would be funded
>by public service agencies, philanthropists, etc).

Agree, but not all people is "forced" to do it. When i use the word force, it's base on my idea of piracy.

>Or, to put it another way, who would buy an Atari if software for it
>cost 2-3 (or more) times as much as for other platforms? You can find

>(great) stuff like the Gnu software, the commercial software is mondo
>expensive... like 3-10 times what it costs on other platforms.

It's the same. The number of users and software isn't gona rise, when there is no way a user can tell if the software he want is going to work. This user will not become an atari user then. And when the prices rise, the number of users falls.

>
>So those who "pirate" software are simply pounding nails into Atari's
>coffin, and eventually there will be nothing left but PD and shareware.

And this is probably the best solution untill a better distribution of software is available for guy's like me with a simular situation.

>

Some people do like commercial, but i don't think it gona work. On the other hand it might bring us better products/software, since the developer is now sponsered and will receive his money this way. But i don't think the developer is going to like this idea, cause that might bring him alot of obligations from the sponser.

I don't think it ever was PD, it was part of Atari's ST development kit
and I know that large parts of this kit were on the boards in Germany
(and some other countries as well). But those illegal copies are not PD.

It's written by people at Atari and I'm almost sure they don't give you
the source unless there is a very good reason for.

2066. Monitors 4 Sale 19"

Newsgroup: comp.sys.atari.st
Date: 1994-08-11 10:52:00 UTC
From: jon.dinga@f422.n250.z1.tor250.org
Message-ID: <119d909e@f422.n250.z1.tor250.org>
Source record: 182349

I have had a Crazy Dots VME card in my MSTe for over a year, and have been, for the moST part, EXTREMELY pleased . I did buy it to use with a 19" mono monitor that I had bought used, and found the software that came with the card very flexible, in that it was able to sync to the fixed horizontal frequency of the card. The only true drawback to the card was that I was not able to use my WARP 9 screen accelerator [I broke down and got NVDI-ET 4000] and it did not have a 100 pixel rate so I could use the full 1280 x 960 . Recently I obtained a RBG 19" monitor, also fixed horizontal scan rate I am currently 'playing' with the software and hardware to get an optimum image. Thanks to all this experimenting I have been doing, I can now offer CrazyDots owners [and other users of cards with the same capabilities] the opportunity to buy large screen monitors that are ideal to use with DTP and MultiTask environments, at reasonable cost.
The monitor I aquired was sold at auction of Ontario Hydro, of their surplus equipment. It was originally part of a HP Apollo workstation, and the group that bought them was only able to get custom [ISA] graphics cards for only 30 of the 36 monitors. As a result, there are 5 available [hey, I got one ;^) !] unless some other person gets to them first ;(.
RBG analog 19" [1140x800 aprox on a CrazyDots VME], 48.8 kHz Horizontal Scan rate, 59 refresh rate [no noticeable flicker]. Date of manufacture 1989, but not used for last 18 months. Complete with custom cable for CD VME card, CRDOTS.INF, and shipping to any where in continental USA & Canada .....
.....650.00 US funds
I also recently found a few of the mono 19" monitors I use in a warehouse, new in the box [or possibly repaired under warranty]. I have no firm idea of how many there are tucked way, but it is a very limited number. [1040x832 aprox on CrazyDots VME] 63.5 kHz Horizontal Scan rate, 65 refresh rate: can be used as a greyscale on a CrazyDots, and has a screen almost as crisp as a SM124. When originally introduced, this was a 2000.00 US monitor[[ouch]] With custom cable for CD VME, CRDOTS.INF, and shipping anywhere in continental USA & Canada
.....400.00 US Funds
At these prices, I am not making a lot, but of course there is a small profit motive [plus I have to finish paying for my new toy soon - a tinyturbo 030], plus I get the enjoyment of lugging these 50+ lb monitors through customs to ship them from Niagara Falls NY. I will warrant these with a personal 30 day, like it or send it back undamaged, warranty.Terms: 50% down,

and 50% CASH on delivery.
Each and every monitor will be inspected and tested on my
personal system, to be sure it is correctly set up. Every
monitor will include the custom cable necessary to hook it to
the CD VME port, so if you have a need for a lloonnnggggggg
cable, be sure to let me know how long!!!!
Offer good only while supplies last ;^)

: to do the upgrade, or is it just a COMPO version of GDOS, things are just not
: that clear on this..??

SpeedoGDOS 5 is the next development of Atari's GDOS, the last version of which was SpeedoGDOS 4.2. We worked with Atari and added all these new things into SpeedoGDOS (note 'into' rather than 'onto' - the new technology is integral to the GDOS engine and transparent to apps that use GDOS). We also took advantage of the opportunity and optimized portions of GDOS where we were able to, so there's quite a bit more than support for new font formats.

: By the way who did the previous development of SpeedoGDOS...?

All previous versions of GDOS were developed in-house at Atari.

: Another point, how big is the new SpeedoGDOS 5.x and how much ram does it now
: need...??

Well, the file size is around 120K, but that's compressed. It occupies about double that, in memory.

regards,

Robert@COMPO

2068. Problem: 520ST+ doesn't boot

Newsgroup: comp.sys.atari.st
Date: 1994-08-11 11:09:42 UTC
From: hab@FIMP02.fim.uni-linz.ac.at
Message-ID: <32d0tm$je9@alijku06.edvz.uni-linz.ac.at>
Source record: 182308

I recently got an Atari 520ST+ with a double-sided disk drive. After having used it for a few days, it suddenly doesn't boot anymore.

When I insert a system disk and issue a RESET, the R/W-head of the disk drive moves to the outmost track (if necessary), the drive motor runs for a short time, then the "Insert system disk" picture is displayed.

I have tried several system disks that worked correctly before. I have also examined the first sectors of one system disk on an MS-DOS machine with a disk monitor: they are readable and seem to contain reasonable data.

I looked into the drive and everything seems to work normal. The motor is running. When I insert a high-density disk, the head moves back and forward for a short time, which it doesn't with double-density disks. Therefore, the R/W-head movement seems to work and enough data seems to be transferred to the computer to distinguish between DD- and HD-disks.

What could be the reason for the unfortunate behaviour? Is there an easy way to find out and fix it?

Richard

Source record: 182323

There is room in the personal computer market that I would love
Atari to fill. I find PCs an ugly technology- Windows and Dos are
just horrible, but they do provide great price/performace. Macs
have a beautiful user interface, but are too restrictive.

If Atari could come up with a computer that has:

- A fast and modern processor,
- Graphics and sound capabilities of the Jaguar,
- An OS that can multi-task and provide a stable and conformant
good-looking environment like the Mac, but can also be told
to request all running processes to terminate and then
dissapear itself so that a game can completely take over
the system; and also (I hate to sat it) run windows
software,

then, I think they would be on to a winner.

SMS2 (a replacement OS now available for the ST) does all the things
you are asking of the operating system, except provide Windows
compatability (which isnt surprising given how much work a
windows+i80x86 emulator for the 68k would take!). And there's
already software available for it (it isnt compatable with TOS
s/w...). Actually SMS2 is also available for PCs on a plug-in
card which includes a 68040 - a sensible move given that for as
far as we can see into the future, PC hardware is gonna be the
cheapest, so using it gives you access to SVGA or whatever as
cheaply as possible.

But the fast processor? It'd have to be a PowerPC chip surely...

Jenny

(Who has nothing to do with any of the companies that sell SMS2, BTW!)

2079. Brainstorm Animation Viewer!!

Newsgroup: comp.sys.atari.st
Date: 1994-08-11 16:25:58 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <32djem$hbj@charm.magnus.acs.ohio-state.edu>
Source record: 182324

Hot damn is this cool! I just found this animation viewer on an ftp site yesterday, and, having my doubts that it would function on my ISAC card, was not optimistic. The readme even says it probably won't work with video cards, but it does! I started up at 4bit 1024x768, running with Geneva and Warp 9, loaded the .acc, and ZING, I had a 320*200 gem window running a 25fps animation with no problems! I'm excited (wheeeeeeee!!!!!) Considering that the ISAC card is awfully slow in 4bit mode, even with a T25, I must add that the programmer must have done one hell of a good job. I don't have sound yet, but then I'm not sure I'm supposed to...

What can you tell me about the FLI/FLC format? Where can I get more movies? Is there anyway to convert Quicktime movies to this format?

What can I use to make my own FLI/FLC format movies?

Oh, something else I ran across that might be handy for those of us using Macs and Atari's is a great little Mac app called ZipIt which handles ST ZIP files just fine...

Happy day, happy day!-)))))

BM> > bytes. Any help would be great.

BM> Picswitch does conversions, but I'm not sure about the sizes you mention.
BM> It is on atari.archive.umich.edu. I believe you want picsw7.arc (not
BM> picsw101.lzh) in the /Graphics directory.

Degas Elite will load both Formats, 32034er _and_ 32066er...
Picture Format is as following:
2 bytes header (For recognition of Packed/Unpacked - in this case
unpacked)
32 bytes color palette (16 words, hardwarecolors)
32000 bytes bitimage, just organised as the computer does

That's 32034er
32066er just adds 32 bytes color palette animation data.

Yasee, it's kidding. Degas will load and save both formats, depending on
palette animation switch

So long,

Gonzman

Panjandrum (dhbutler@magnus.acs.ohio-state.edu) wrote:

: What can you tell me about the FLI/FLC format? Where can I get more movies? Is
: there anyway to convert Quicktime movies to this format?

FLI is a "delta-compression" movie format, where only the changes from
one frame to the next are recorded in the file. If you have a simple
movie with not too much detail, you can get decent compression ratio.

: What can I use to make my own FLI/FLC format movies?

On the UNIX side, there is a program called FBM2FLI which will take
any file format which the FBM utilities know how to deal with
(which is A LOT) and convert them to an FLI animation file. The
source code for the FBM utilities and FBM2FLI are all available,
so writing an ATARI-specific version "shouldn't be too difficult"..

aR> They probably WERE ashamed, as they should. Showing the Falcon
aR> is the same as showing an old ST with the keys painted a little
aR> darker! How could that have a positive effect on sales?

Well, for one they *could* show it running cubase audio.
I just got one of the new betas for testing for the Norwegian importer.
My god is this a TRULY AMAZING program. I can hardly believe it can do all
the things it does...

Like, I have this old slow CDC 300 Mb drive, which I "borrow for an
indeterminate amount of time" from a local firm. Well, I just wanted to be
bad, so I started to test how many tracks I could torture this drive into
doing... Well, It managed 6 tracks at 44.1 kHz. The busy light was then
continuously lighting - it looked like it was the power lamp... But cubase
audio was working like a charm - All controls were available and working,
like the machine wasn't doing anything at all. That is except doing 529200
bytes/sec reading from disk, adding reverb effect and mixing 8 channels,
playing back 6 midi-channels, 8 audio-tracks (2 from RAM), etc. etc.
That is one hell of an amount of data being worked on in real time.

Too bad that these IO routines aren't part of the operating system, but
we're getting there, closer and closer. Interrupt driven disk io should be
right around the corner now (I'm working on it).

Just couldn't let this stand undefended.
The Falcon is a *GREAT* machine for doing what it was designed to do - Midi
and hard-disk recording.

<some stuff deleted>

aR> I.e., anything not produced by Atari will do... (Although I'm quite
aR> happy with the look and feel of my TT).

Jess, that is my regrets too. The Falcon should have been built into a proper case, have a proper keyboard and the TT's DMA-controller/Bus/CPU-speed. Basically, it should have been a TT with the extra audio/colourstuff that the Falcon has.

Sorry for using the account of my friend, please don't reply to this
artcile, send mail to Harun_Scheutzow@B.maus.de

Michael Smith (miff@apanix.apana.org.au) wrote:
> Some people may remember I said I was relaying & manufacturing the RSVE
> serial accelerator board...

Very, Very interesting.

> I'm asking $50 Australian for it, including P&P anywhere in the world.
> This also nets you english installation instructions, and includes a
> royalty to the original designer.

I am a bit surprised that I never heard of you in the past. No mail,
nothing. Sorry, that I read this article. But I don't remeber that I
gave permission for commercial use of RSVE to you. Yes, I think this
is a commercial useage, not only but too because of the price.

> Please note that I'm hardly covering my costs here - hence the significantly
> lower than expected price. I'm not out to make my fortune on this one 8)

I can't believe that. The price I sell RSVE for is 60DM in Germany, 61DM into
the rest of the world by "slow" mail and 66DM by air mail. I am convinced
that I put a bit more work into RSVE than you. And the price seems me to be
nearly the same as yours.

I'm wondering what your explaination is!

> PS. If there's some other gizmo like this floating around that you think
> would be useful to the ST community, let me know.

Hoping that nobody supports such kind of piracy ...

Hi,

I am using a local BBS as a mailbox. It is a MessDos bbs and supports
offline reading via a program called Blue Wave.
This Blue Wave program uses some special format and I am looking for
an Atari offline reader that supports that specific format.

Is there anybody here that knows if:

a/ such a program exists
b/ what it is called
c/ where I can find it

It doesn't really matter if it is shareware or not. I don't mind to pay for
it. I will earn the mone back on my phone bills in notime.

Thanx for your help

In a previous article, Kim@dksoft.ping.dk (Kim Andersen) says:

>>Ahhhh.... errr somebody found that bug.... hey weeeelll you're just too good for us
>>(I must admit I honestly thought it couldn't seriously be done...) but it will be
>>fixed!
>
>And it couldn't. My score went back everytime i reach 100mill 8-)

Or.. why not try making the game a bit more difficult then? After playing for
a while it certainly felt like it would be possible to get over 100 million.
(Except for the fact that, as you may remember, it crashed before I got
that far). I installed a few mods now after I got my Falcon. Music on the
background is cool, but I'd rather have the same system as in Pinball Dreams
and Pinball Fantasies. The game developers could get someone to make the music
and having the samples stop the tune every now and then was a surprisingly
good idea. You get kind of bored listening for about half an hour to the
same module, however long it is. Why not add real samples instead of ST-
beeps, everybody has an STe or a falcon now anyway :) You could of course
have an option for turning the samples off if someone wants to play the game
on a basic ST.

No, no, no, I would be happy to register a good game demo that had only one palyable level. That to me would be proof enough that the program works, and shows me that it's worth registering. I'll give you a specific example.

I downloaded R_Qwk and ST_qwk in hopes of adding this feature to my bbs. When I read through the docs, it said that this program will NOT work until registered. This seems to me like a form of black-mail!

Now, everytime I add one of these programs to my bbs I add the note about registering. I don't think that people should be mislead into believing that they are getting a running program when all they get is some piece of who knows what that does nothing more then use up disk space.

Hello Atarians!
There is a SIRDS/SIS maker program for Atari on

ftp.tu-clausthal.de:/pub/atari/graphics/sirds/

It's written in GFA and very slow, but the results are quite good (IMHO).
The program is called AtSIRDS/AtSIS and it's basically a port of the
routine from the SIRDS faq with some enhancements.
There are also two images I have done with this program.

You need the GFA basic interpreter to run AtSIRDS/AtSIS.

bye,
Chris

>*shrug*

I'd get CuBeat from the makers of CuBase (Steinberg). It's around 80 pounds in the UK, so probably around $100. Best thing about it is that you won't have to unlearn your skills if you move up(?) to a PC or Mac. It also has nearly all of the features, and in my experience is pretty crash-proof.

Documentation is good, and it has a dongle, so you get the feel of having a more pro package.

Just my 2p ($0.029)

And for the most part they're right. I suppose it's whatever you feel most comfortable with ... if you don't mind the risk, perhaps cash is best. OTherwise I suppose to some extent the extra cost is justified.

>I wish the situation could be better, cause that would hopefully give a better
>market too. But it just doesn't work here. I keep my 4 atari machine because
>i like them, and because i'm a musician. And for the musician here in Denmark
>the situation looks far more better than for the common atari users.

Indeed. Some places are harder to get into as far as the Atari market is concerned. Here in Canada, just like many other places, this is a PC-dominated market. Atari plays a small and seemingly insignificant role. However at least some believe in the alternative to DOS boxes. I'm among the strongest of those believers, as I've worked extensively with DOS boxes, as well as Macs, and I can safely and honestly say that those platforms don't offer me any incentive whatsoever to switch.

>I'm sorry to say i don't agree. But this is based on my experince with the
>market. As an sysop i know many atari persons, (both here and in other countries
>).

I suppose it depends on your perspective, but I am merely drawing on my own personal experiences as to how a lot of people treat shareware, and what makes them register. I conducted an impromptu survey before I released Fansi asking what makes people register, and what disabled features would turn them right off, and what would encourage them to register. (Someone here suggested beg screens popping up every 10 minutes or so... my survey, however, turned up that this is the #1 reason that people DON'T register; beg screens just turn people STRAIGHT off. The #2 turnoff was disabled save features)

>Then i think you should change you'r opinion about shareware, and make your
>programs as demos insted. It will probably sell the same, but now you don't
>have to sit tight and wait on the registrations. Maybe turtials would be better.

Changing its official status from "Shareware" to "Demo" won't change a thing. And in my opinion, I still believe that my program is Shareware. The fact that it has some features disabled doesn't change that fact in my own opinion; they are still getting a functional program; they can still work with it and save their pictures and whatnot. Their registeration

merely gives them more of those features and makes it even easier to create screens with. It's the incentive I feel many people need to register.

>It's okay.. I'm having a hard time as well keeping up all my work.

For me, it's sifting through E-Mail both for me and from the Jaguar newsgroup/dev group, and having a half-hour time limit. :-)

Please Please Richard, I thoght Atari would have sent you the System
Roms by now, please why are you still using a TOS system disk...??

May be some one can send you a set of TOS roms, from memory
you will need the 6 chip set, but what type of Language is this
ST...???

The TOS on a disk was just a stop gap thing untill the roms came out...

Not necessarily true Uwe, new I agree they are extortionate, but I've
just taken an opportunity to pick up a SCSI->Ethernet box for as
little as 15 uk lbs. Now all I have to do is write a device driver
for it. I've been studying Kay's driver code for plip, and the
generic /dev/scsi driver for the atari range. Hopefully with a mix
and match I'll get something together.

The idea is that it's a damn sight cheaper to have a DX-66 running
Linux and a Xcompiler than to buy a Medusa... Put ethernet between
them, and it ought to be rather nice :-)

I've been doing this recently with CS-TeX 4 and Ghostscript 2.6.1
It works OK using epsf.sty and including the desired EPS file. One
problem though is that when you scale the EPS figure to be included,
the figure is no longer centred on the page - this is completely
independent of TeX - it has something to do with the PS TeX dictionary
included by DVI_PS. I've played around with it so it would center the
figures I wanted (MATLAB output) but it doesn't handle scaling
properly for general files.

Anyone out there have any suggestions? BTW, I ususally print
all my document pages that don't have PS with the standard Laserjet II
driver from CS_TeX because it's really fast. I use Ghostscript for
the pages with figures.

>even looked around much to see what's available nowadays. The most
>outstanding feature I've seen from this type of software is the price!
>One package goes for $900! Yikes!

Most of the major sequencer companies have come out with 'Lite'
versions of their blown sequencers. These are specifically
designed with entry-level people in mind. Check out Notator Alpha,
Master Tracks jr (Trax I thinks its called now), Cubase jr, etc.

Another possibility is to look around for musicians who are moving
from the ST to the Mac or PC platforms and are dumping their old
software. You might be able to pick up Creator or Cubase at
a reasonable price. I have seen some locally in the want ads and
in used music stores.

Good luck !

2127. Speed of Light Problems...

Newsgroup: comp.sys.atari.st
Date: 1994-08-12 16:32:09 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <32g869$mai@charm.magnus.acs.ohio-state.edu>
Source record: 182260

>Good News! The next version of Speed of Light will have an automatic
>picture switcher that acts as a slideshower. Complete control over delay
>times can be set. Look for it in the next month. v3.6 maybe...

Sounds great. I was going to post today in an attempt to get ahold of the author in the first place (I assume this is your post?) because the version of SOL which I downloaded does not function properly on my ISAC card. It refuses to realize that my "low-rez" screen is actually 1024x768 pixels, and when displaying a image it places the first 320x200 pixels of it in the upper left corner of my screen and then provides garbage... I can't remember the version number however... It was the latest one at University of Michigan. So far this has been a problem with many 'non-gem' applications; they seem to assume that screens are a certain size instead of checking. Am I missing a setting that I could use to fix this problem, or will I have to wait for a future version?

Thanks...

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's 'Statistics of Deadly Quarrels'. You've probably never heard of it even though its relevance to the mess you're in is at least as great as that of Darwin's 'On the Origin of Species,' which you learned about in fourth grade. And that's because it's so completely terrifying only those 'experts' who are adequately armoured with preconceived contrary ideas which will enable them to disregard Richardson's work completely ever get to study it."

>GCC compiled files are twice as big as Lattice C compiled files on the ST
>in my experience. - Matthew

Hi,

I don't want to start up the C-compiler thread again, but what
about speed? I thought the GCC-compiler was simply the best, at least
speed-wise. Before that, I always thought Turbo (now Pure) C was the
best, and I bought it. I still don't regret that, since I was a C
novice at the time\footnote{\dots and still am\dots}, and the online
help is of great use. I use GCC for my programming assignments at Uni,
but haven't set it up at home yet --- I'm waiting for my Falcon. Now
could some kind soul tell me that either GCC is still the way to go for
the final compilation of a finished project, or I should fork() out a
lot of cash _again_ and buy Lattice? From the `compiler thread' I
concluded that Turbo C is not really useful due to some hacky stuff
which I didn't quite understand, I must admit, something with parameter
passing through processor registers to gain speed?

Thanks in advance,

I'm thinking of getting out of the Atari circle, and I'm curious if my equipment is sellable.

I have available:

1 Mega 4 STe with 4 Mb RAM, 50 Mb HD
1 Atari Colour Monitor
1 Atari Monochrome Monitor
1 1200 baud modem
1 2400 baud modem
A whole bunch 'o software (ask me about it)
1 Atari ST with 1 Mb RAM
2 external sigle sided floppy drives
all cables.

I would like to get around $500.00 Can. for the whole bunch, but will look at offers.

Anyone interested?

Mike.

I watched a demo of MIDI Spy a couple of days ago. It was a true
multi task software that ran with many other programs. The computor
played music while it saved music while the operator teleconferenced.
I found it very amazing. It ran on a 1040 st in the demo.
I am now looking for a copy. If anyone is selling it please email me
Thanks - A J Thomas

2136. Mastersound II - software needed

Newsgroup: comp.sys.atari.st
Date: 1994-08-12 18:34:00 UTC
From: dag.dao@dada.ct.se
Message-ID: <2e4bcf05@ct.se>
Source record: 182292

Recently I bought an STe for my son. Bundled with it were - among many things - the sampling device Mastersound II. However, two files were corrupted. First MASTER.SEQ, apparently some kind of demo, & presumably not so important. MASTERII.PRG on the other hand, as of course the cartridge is useless without it.

Therefore, I'd now appreciate very much if some kind soul out there with this device would look at his/her master disk to see if this file is there; if it is, it should be 64885 bytes of size, & of course a uuencoded email containing this file would save the day for me & my son respectively. 8-)

Thanks in advance,

DaDa!

If you are trying to use Pure C, I do not have Turbo C, to pass parameters
to a routine compiled with a compiler that uses only stack parameters uses
the 'cdecl' directive when declaring the interface for that routine.

Using the same mechanism you can make your public interface use stack parameters
using the 'cdecl' directive. You need this if you are trying to write a device
driver or file system for MiNT using Pure C.

It works for me :)

Ok, I think telecomm programs are a religious issue for lots of folks, similar to, oh, say, TEXT EDITORS, and that too much politeness is better than too little, in general. I also think that folks who spout off about wasting bandwidth should first try to figure out when email might be more appropriate than a world-wide Usenet post, and how to include the correct number of signature files in their articles.

I am of the opinion that a few IMHO's here and there would head off a lot of the little flame wars that occur on Usenet groups, thus saving much more bandwidth than they use. One example would be if I had said something like "CoNnect is the best", which would have undoubtedly generated a bunch of responses about why Uniterm/Ansiterm/teddyterm/etc.etc. is actually "the best" (a subject that seems to be pounded into a pulp monthly in this group). Also, I have a funny feeling that the responses to your post above will be another shining example of this (i.e. silly flame war that does little more than waste bandwidth). I have no problem with flame wars in general, but I see little reason to spark them with poorly worded, poorly thought out, or poorly disclaimed posts (unintentionally, at least).

If you find my posts irritating, add me to your kill file or make a constructive suggestion via reasonable channels. Criticizing my inclusion of ~30 characters that you did not like in my post, WITH ANOTHER POST, and claiming that bandwidth was your concern is absurd, IMHO.

The best Gif viewer i have seen for the Falcon is made by a german user
on the mausnet. It's called Turbo Gif, and this guy, (hmm i think it's a
girl), sure layed her hands on the turbo expression.

It runs on the Falcon only, no matter what color mode you'r in. (it'll change
by itself), and it's the fastest i have ever seen.

I can only recommend it, cause it's also freeware.

Greets
Kim

Ups. Forgot to mention, it also has somekind of hardware scrolling. Sure
looks great.

If you can't find it anywhere, it's available at my system called DK-Soft

Ofcouse. I don't agree on my banks tax's, cause when i send money to someone in eg. the Uk i have to pay for sending the money, but also have to pay for this guy to receive the money, (which is a pretty stupid policy in my opinion). I talked to my bank clerk about it, and he did agree, but couldn't do anything about it. The best solution would be, if all developers could handle VISA, as it's an international money transfer organisation, which doesn't cost half as much as the normal bank.

>I suppose it depends on your perspective, but I am merely drawing on my own

>beg screens just turn people STRAIGHT off. The #2 turnoff was disabled save
>features)

I don't know where you did ask, i have seen you'r in AtariNet as well. Maybe thats where all the conversation was going on. But normally disable the saving will be a good reason for registring the program. On the other hand it'll also be a good reason for cracking it.

>Changing its official status from "Shareware" to "Demo" won't change a
>thing. And in my opinion, I still believe that my program is Shareware.
>The fact that it has some features disabled doesn't change that fact in my

>work with it and save their pictures and whatnot. Their registeration
>merely gives them more of those features and makes it even easier to create
>screens with. It's the incentive I feel many people need to register.

It was more meant to be from the users point of view. They no longer have to feel they're beeing forced into registering your program, when you feel they should. They will registre if they feel like it, and also this will kill much of the thoughts around piracy as they will no longer be counted as pirates.

>For me, it's sifting through E-Mail both for me and from the Jaguar
>newsgroup/dev group, and having a half-hour time limit. :-)
>

I wish i had that long. I'm having a terrible problem here on my system since last night. I installed a CD-Rom, and now eveything is bombing due to using the MetaDos driver. And as usual i'm on my own 8-/

It is a development from Atari's original source code.

>Another point, how big is the new SpeedoGDOS 5.x and how much ram does it now
>need...??

It's just over 100k and uses about 20k more RAM than before. However, if
using TT/T1 fonts it's better to have larger caches set up.

: various animation formats (especially quicktime) to FLI and FLC formats. Also,
: any information about where to find a collection of animation already in
: FLI/FLC format would be greatly appreciated.

The fastest and easiest way to get lots of FLI/FLC's may also be the most expensive, initially anyway. Get a CD-ROM drive and:

1) 5 Star Games - also AVI and MPEG!
2) (PC) Animation Festival
3) 3D Animania

These three CD's were purchased at a computer swapmeet for between $5 and $20US each. This ought to give you several hundred FLI/FLC's to watch.

Sam

2151. 4 Meg memory boards for 520/1040 st's

2154. Mail to AtariNet addresses

Newsgroup: comp.sys.atari.st
Date: 1994-08-13 04:57:00 UTC
From: Ray.Brown@702.dswhq.omahug.org
Message-ID: <45e_9408130018@dswhq.omahug.org>
Source record: 182250

DO>Stupid Question number One, but how on earth can I get mail to
DO>an AtariNet (or
DO>even a FidoNet address)? I've had a look in a lot of places to
DO>try to find
DO>some sort of information but so far it has proved elusive...

. Hello! I will try to answer.

. I believe the syntax should be in the form

r.brown@n1701.f286.z1.fidonet.org

. I might possibly have the "n" and "f" transposed, but my normal
FidoNet address is 1:286/1701.

. And, to make this kinda on-topic, I am still using a venerable
1040 ST, with TOS 1.03, and a Mega 30. I originally bought it to run
TimeWorks DTP, and I still use just it, although I ought to upgrade
to TW DTP v2. <g>

. Hopefully, I'll be picking up this conference on my own BBS, "Deep
Space 417" shortly. If not, then I'll just have to call back in once
in a while. <g>

. _Ray_

Falcon030 poll results.

First I'd like 2 thanks those who'ved answered (surtout les
francais : merci) I've got 34 answers.
TOS

8.8 % have tos 4.02
11.7 % ------- 4.01
73.5 % ------- 4.04

Ram

79.4 % have 4 megs and 20.6 have 14 (or 16) megs

Average Internal Hard Disk Space : 128 Meg (94.11 % have one)

Average External HDS (SCSI): 304.04 (55.8 % have one)

100 % have HD.

41.17 % got FPU (I asumed no answers as NO)

41.17 % have VGA, 17.6 % TV, 38.2 % Multysynch and 23.5 got
misc display screen.

For the peripherials I 'll give a list:
Syquest 44 : 2
Syquest 88 : 1
Tape : 1
CDRom drive : 7
Modem : 13 (9 at 14400 1 at 2400)
Printers : 22 (9 dot Matrix 6 color incjet 5 b&W incjet 2 Lazer)
Plotter : 1
Genlock : 1
Digitizer tablet : 1
BlowUp : 5
ScreenBlaster : 3
External Floppy Drvive : 2 (at 2.88)

From: steve-j@teleport.com
Message-ID: <32i3s9$q2h@elaine.teleport.com>
Source record: 182296

If you want to automatically disable the keyclick whenever you
boot your ST/TT/Falcon w/o having to use a Control Panel .ACC,
look for a small program called KEYCLICK.PRG and put it in your
AUTO folder.

2162. Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1994-08-13 10:08:45 UTC
From: rimkusul@papin.HRZ.Uni-Marburg.DE
Message-ID: <32i63d$ln1@surz03.HRZ.Uni-Marburg.DE>
Source record: 182300

Hy!
Someone gave me a Sprectre GCR for testing. And I guess I like it. But is this thing still available? What is the recent software?
Then I tried to install System7, but had no luck. Almost the first install-disk cannot be started (gave me some message, that I have too few memory, but I have 4MB). Did anyone install System7 on a Spectre GCR virtuell Mac?

Greetings, Ulf

>Whoa there, whaddya want to get another machine for ????? Have you taken
>it to a computer store for a repair estimate ? You could probably get
>it fixed for *much* less than it'll cost you to get another.

Well, seeing as used ST's are now running in the hundred-dollar
range, I can't see repairs costing less than that. The ONLY repair
job I've seen cost less was to fix a spacebar that wasn't working; that
cost 20 bucks. It's also an hour drive to get to the only known Atari
repairman in this area. If the repairs cost 50 bucks or more, I'm
better off getting a new one. If anyone feels that such an ST is
worth their trouble, give me a discount on a fully-functional one
and I'll send you the almost-working one.

Hi,

My Pro80S worked fine with the EP jumper set and SCSI-ID nummer 0 on the
drive. Shouldn't you set both addresses the same?

Sorry for follow-up, can't e-mail to you.

Ton.

It is still available, and the newest available software version is 3.0.
Version 3.1 has been promised for some time, and is supposedly coming
"real soon now".

> Then I tried to install System7, but had no luck. Almost the first
> install-disk cannot be started (gave me some message, that I have too few

Version 3.1 is supposed to have System 7 capability, as well as enhanced TT
compatibility and numerous bug fixes.

I really like my Spectre GCR. It opens up a whole world of additional
software, and seems to be more fault tolerant that a real Mac in some cases
(given that one is running System 6.0.x, of course)!

I would like to know about this, too. I have a SC-155. The software I need should run on an upgraded 520ST (4meg RAM w/ Turbo16 pref. in mono hi-rez).

Just fyi: I have asked Roland's reps on CompuServe about whether they intend on porting their CanvasMan pkg to the Atari. In several weeks I've received no answer from them. Either they're not monitoring their account on CIS, or they're ignoring me, or the Atari line really is officially dead nowadays.

(p.s. I've never gotten my subscription to Roland's music magazine either, and once again their reps on CIS haven't responded to an older msg I sent regarding the "free" issue us SC owners were entitled to according to the pamplets I got w/ my SC-155.)

2175. adSCSI micro st adapter for US$40, where ???

Newsgroup: comp.sys.atari.st
Date: 1994-08-13 19:17:14 UTC
From: putney@suburbia.apana.org.au
Message-ID: <putney.776805434@suburbia.apana.org.au>
Source record: 182175

I recently saw a posting on this newsgroup that mentioned ICD adscsi micro st adapters for $40 somewhere in the states. Infact if I recall correctly the person actualy sold these. I would greatly appreciate any help in locating one of these internal SCSI adapters for my MEGA at this price. Also if someone could let me know what other types of internal upgrades are available for the Mega. I understand icd make an accelerator board for the st. How much are these, are they compatible with most (all) software ?

thankyou,

Putney@suburbia.apana.org.au

>The results would have been less reproducible. Graphics speed is tricky
>because bezier curves can be sped up a lot by giving up smoothness. Maybe
>someone should write a new benchmark program. Anyway text output is the
>most important factor of VDI speed for most users IMO.

I already have started adding Speedo tests to GEMBench. There are several
problems I'm facing with this and I will list them here in hope that some
of you may have helpful ideas and solutions:

* GEMBench main window wil have to be split into 2 or 3 windows. One for
CPU stuff which I will extend to do more complex general purpose tests.
Another window for the VDI and Speedo tests. There's no more room for
test in ST-High. If anyone can think of a different way around this
please let me know. Maybe some of the tests I do are not really
required.

* The main idea in GEMbench is that you are able to _compare_ systems.
This is easy with static functins like objc_draw() and vro_cpyfm()
because all machines of the same spec return the same results with
+/-2%. Speedo is more of a problem because the speed depends on the size
of the caches and I do not know how NVDI 3 caches are set and whether it
supports the same cache OS calls like SPeedo. Even disk access speed can
come into the equation.
Even if it does, I can't see how I will be able to give a clear
percentage figure as I do with VDI and CPU tests.

* I suppose I can avoid some of these problems by making sure that the
current cache is large enough to contain the characters for the test,
flush it, do a dummy draw of the characters to fill the cache and then
start the test. I will have to stick to one font - so it will probably
be Swiss or Time Roman which everyone has.

* I would like to know which Speedo functions are mostly in use by
programs so that I can test them in proprtion to 'real-world' usage. For
example - how often is v_wc_justified() used, how about vqt_pairkern().

* I have already got a Bezier test routine and I can confirm that Speedo 5
is about 3.5 times faster than Speedo 4 with NVDI 2.5 installed.

* In the mean time I will be releasing an intermediate version, probably
3.5 which will include many new features but no Speedo testing.

* Thanks to everyone who has registered GEMBench. The number of regs has
certainly encouraged me to continue development.

2180. Grandad 2

Newsgroup: comp.sys.atari.st
Date: 1994-08-13 20:49:47 UTC
From: ewj8218@u.cc.utah.edu
Message-ID: <32jblb$kn2@u.cc.utah.edu>
Source record: 182238

I am having trouble running the game Grandad 2 (files grandad2_1.zip and grandad2_2.zip) which I downloaded recently from atari.archive.umich.edu. The opening cartoon works fine, but when it finally gets to the title screen, it spews 11 bombs and freezes up. Anyone encountered this problem?

From: krlawson@freenet.hut.fi
Message-ID: <32jg88$kae@freenet.hut.fi>
Source record: 182227

Could somebody please tell me if it's actually possible to stick a
3.5 inch IDE into a falcon? I think someone asked about this at some
earlier point, but I didn't get the answer.. If it's possible do you
need some special DIY knowledge or do you just simply slot it in?
3.5 inch drives are MUCH cheaper here in Finland, so it would be really cool
if I could fit one inside my falcon's case..
If possible answer me with email because I don't get to read usenet news
very often :(

Whether you like STF or not, surely you can't believe that the closure of /any/ ST mag will help the current situation? I respect your opinion in that you don't like the magazine, but how could the closure of STF help the Atari market? Actually, I'd be interested to hear why you think the mag is crap, and when was the last time you bought an issue?

It seems your graphics card does not set up the VDI information properly.
Speed of Light is NOT fully "non-GEM." It uses GEM for all it's dialogs
and other things, the ONLY thing that is not GEM is how it displays the
images. I'll try to see if I can find out what is wrong with the display.

I have a Mega ST4 with TOS 1.2 as well. Perhaps our TOS is the
problem. Thanks for the feedback. I thought it was either my TOS or an
STE incompatibility.

The problem with accepting a credit card is that the programmer, then, has to foot the bill for the transaction fee. I'm not sure how much it is elsewhere, but I believe each transaction fee here in Canada is somewhere in the neighbourhood of $4 per. Thus, I would either have to accept the loss, or increase the cost of my program to cover it. Neither way is an acceptable proposition in my opinion; if I increase the cost of my program, people will save on bank fees, but lose on the additional cost of the program. Realistically, it's a losing proposition from both perspectives. The only difference is who the one to lose is.

> I don't know where you did ask, i have seen you'r in AtariNet as well.
> Maybe thats where all the conversation was going on. But normally disable
> the saving will be a good reason for registring the program. On the other
> hand it'll also be a good reason for cracking it.

That's a large part of it. The more crippled you make a program -- even if it's only one feature, but a critical feature -- the more incentive there isf or the program to either become cracked by pirates or distributed from someone's registered version. One way or another, pirates will get their hands on a program, no matter how they have to do it. It's something that can't be stopped no matter how clever you are at protection schemes. If it can be made, it can be unmade.

> It was more meant to be from the users point of view. They no longer have
> to feel they're beeing forced into registering your program, when you feel
> they should. They will registre if they feel like it, and also this will
> kill much of the thoughts around piracy as they will no longer be counted
> as pirates.

I don't think it's up to me to make that distinction. If it is a question of moral obligation, then it is the users who will have to make that decision for themselves. How I classify a program does not change anything; users will percieve the program however is most convenient to them. Nowhere in the docs do I acutally state that they have to register _that_ version; I merely suggest that if they want to get a fully working registered version then they should register to get it. There is no real moral obligation or

pressure simply by the application of one or another term to describe the status of the program. That's entirely up to the user.

> I wish i had that long. I'm having a terrible problem here on my system
> since last night. I installed a CD-Rom, and now eveything is bombing due

First you can get the latest Supra Utils from there BBS in the USA and they are
also on GEnie..

Second, they are many many years out of date, and may not support the disk
drive you have fitted, so get a copy from ICD of there Pro utils. they
work great and support BGM partitions that Supras don't, plus
many other great features..

While I find ST Fromat's coverage of productivity and utility apps to be skimpy, it is still a good way to find out what's out there. The best way for the Atari to truly die is for there to be no way to report on what's available. We need a couple of magazines, even if they aren't of the quality we'd like.

Toad is at 1-800-448-TOAD. I was under the impression that the Gemulator
had dropped to $99, but perhaps I am mistaken.

Well, both the program and the shell for it reside on atari.archive.umich.edu
in /Utilities. It appears to be version 2.3a of PGP.

UR> memory, but I have 4MB). Did anyone install System7 on a Spectr
UR> virtuell Mac?

Ulf - the problem is with System 7 - according to David Small,
Spectre GCR's coder/creator, it appears that Apple designed System 7
so that it couldn't run on anything other than a real Macintosh (or
as David put it, an "emulator killer").

There is supposed to be an upgrade available, although David is
supposed to have been real quiet lately according to what I have
heard. He's had a number of things happen to him (including having
an accident befall his son) that required a lot of personal time
away from Gadgets by Small.

Anyway, you could try to get in touch with him at :

It seems to me that this is the best idea - whenever anyone uploads a
crippled shareware file (especially one like RatQWK which now doesn't
operate /at all/ without the demo key), they should make sure the file
description or whatever says so. I know I've been annoyed in the past
downloading a file just to find out it's crippled to the point of being
almost no use at all. I don't disagree with this method, I just want a
warning before I download it :-)

I got my copy from umich, and STZip 2.6 unzipped it fine... There
shouldn't be a problem with it if you use any of the versions of STZip
above version 2, though. Has your copy been corrupted during the
download?

Yes, there are several versions for Ataris out there (well, at least
two that I know of). There is v2.3a which is widely available all
over the world and v2.6ui which seems to be mostly in Europe due to
some possible legal issues with using it in the US. The 2.3a version
along with a GEM shell program that I wrote is available on the
umich archive, atari.archive.umich.edu, in the utilities directory.
It's also available on hensa, as I am sure Danny has already or
soon will post. :)

You need Mountain Reader, and version 2.0 is available on
atari.archive.umich.edu in atari/Telecomm as (I *think*) M_READ20.LZH.
It is shareware, and this version is a limited demo version, but it
handles the Blue Wave format.

] English docs, but where is the .PRG to run the files (.HYP)

Well, it's all 100% English as far as I can see!

As for the PRG, in the STG_E_01.LZH file there are 2 archives,
ST-GUIDE.LZH and STG_UTIL.LZH.

In ST-GUIDE.LZH there is the ST-GUIDE.PRG file (in the "root" directory
of the archive). Just double-click on it or drag the HYP files to it, and
they display! Why we just don't stick to plain TXT files I don't know,
with something like GUCK (Brilliant text-displayer), finding specific
items is easy, just hit "f" and enter a string. HYPErtext stuff is to
cluggy (good word that :). Mind-you, it's no doubt better for some :)

>The only difference is who the one to lose is.

Agree, but as long as we give the authors the money insted of spending them
on transactions which will only benefit the banks, i have no problem with
that.

>That's a large part of it. The more crippled you make a program -- even if
>it's only one feature, but a critical feature -- the more incentive there

Exactly. And since you can't do anything about piracy, i think it's better
to waste the time on those who perhaps will registre your software.

>I don't think it's up to me to make that distinction. If it is a question
>of moral obligation, then it is the users who will have to make that

>pressure simply by the application of one or another term to describe the
>status of the program. That's entirely up to the user.

And then it's not a shareware product you released, but a demo version. Now
you maybe start to see my point. If it's a demo version, there can be no
pirates using it. And no matter if it's called a demo or shareware, you'll
get the same amount of registred users. But the count of pirates will drop.

>Even as I speak I'm getting the old "two minute warning" from my site.
>*sigh* Time to be going, I suppose. Congratulations on the CD-ROM... I'd
>like one myself. Hope you get it working, soon.
>

A good idea is maybe to use UUCP insted. Offline reading/writing is much more easy to handle, and there's no time limits what so ever 8-)

I got my CD to work allright, (took me a few days and alot of calls to the UK, which means alot of wasted money, but i'll hopefully survive). Anyway, this f* cookijarr program did it all. Most of my software refused to run with the MetaDos driver, when i had this Jarr program running. Now it's gone, and then i'll just sit here and wait what will happen, when i havn't got enough jarr's 8-/

2233. Hype and Viruses..

Newsgroup: comp.sys.atari.st
Date: 1994-08-15 00:54:25 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <32mec1$r36@golem.wcc.govt.nz>
Source record: 182176
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I see there is a lot of rubish being posted about Viruses,
ither from people that have vested intrest in selling Virus Killers
or teenagers that just don't know....

There are NO Keyboard buffer viruses, no Hard Drive boot sector Viruses,
there are some Floppy bootsector viruses, but they are very simple to detect
and fix...

A boot sector Virus is as it states, it installs its self ONLY on boot up,
so checking disks for valid boot sectors is all that is needed, but you must
boot your Atari with out a disk first, or with a know Virus free disk..

Viruses can't write to a write protected disk, its that simple...!!!

With a sector editor, read the boot sector, Track 0 sector 1, check if the
first byte is a 61 and change this to a 00, if this stuffs up the program on
the disk, then change the 00 back to 61.....

Virus check programs wipe the hole boot sector, so be warned, you can't recover
them...

NOTE: most and if not all Boot Sector Virus protection programs are VIRUSES
in them selves, as they will copy them selves to other disks....

When playing (Booting) with unknown floppy disks, Turn of your Hard drive, or
dissable the booting of the hard disk, a Ship program can turn off internal
hard drives...

I have never had major problems with Viruses, and I see no point in spending
money on Virus check programs....

NOTE: The bigest Virus for STE's users is the old DMA chip, it has stuffed up
2 Hard Drives for me....

NOTE: A valid floppy boot sector is when all the bytes add up to 1234 as a sum
check, pad bytes are added at the end of the boot sector to get a valid
boot sector, so changing any byte would make the boot sector invalid...

Just some food for thought....!!!

```
] I see there is a lot of rubish being posted about Viruses,
] ither from people that have vested intrest in selling Virus Killers
] or teenagers that just don't know....

Ahh, it's all age related - I see it so clearly now....

] There are NO Keyboard buffer viruses, no Hard Drive boot sector Viruses,
] there are some Floppy bootsector viruses, but they are very simple to detec
] and fix...

What if you're a computer newbie or don't have the required software?

] A boot sector Virus is as it states, it installs its self ONLY on boot up,
] so checking disks for valid boot sectors is all that is needed, but you mus
] boot your Atari with out a disk first, or with a know Virus free disk..
] Viruses can't write to a write protected disk, its that simple...!!!

Ever tried saving text files to a write-protected disk? Some folks don't
have hard-drives!

BTW, on the subject of "No Hard-Drive Viruses", maybe not, but check this
out (swiped from the UVK documentation)

] Name: Beilstein Virus.
] Type: Reset-proof memory-resident bootsector call virus.
] Discovery date: March 16th 1993 (Volker Shnitz).
] Virus can copy to drive(s): Current floppy drive (A or B).
] Virus attaches itself to: Hdv_bpb, Vbl_queue, Hdv_rw, Hdv_boot,
] Gemdos, Xbios, regularly reset-resistant AND undocumented reset-
] resistant.
] Disks can be immunized against it: No.
] Immunizable with UVK: No.
] What can happen, and when: 1) It can delete specific files when
] these are loaded by the user. These files are 'SAGROTAN', 'MDISK',
] 'FCOPYIII', 'FCOPY3??', 'DISKUS', 'DISKDEMO', 'TED_???' and
] 'G_COPY', 2) It can clear partition "C" of your hard disk when the
] virus in memory discovers that you are trying to trace it (trace
] bit set, for example in a debugger), 3) It can create garbage on
] your screen, 4) Keyboard, mouse and joystick can be disabled, 5)
] Mouse movements can be inverted (like with the "Ghost Virus"), 6)
] Printer output can be corrupted, 7) Modem output can be corrupted,
] 8) A bomb error can be created, 9) The system can be frozen until
] you enter the password "Apokalypse", 10) Memory can be cleared,
] followed by a reset, 11) The first hundred sectors of a floppy
] disk can be cleared, and 12) It can delete a folder. These are
```

] quite an amount of things that can go wrong!

Harmless for hard-drives!? I think not!

] With a sector editor, read the boot sector, Track 0 sector 1, check if the
] first byte is a 61 and change this to a 00, if this stuffs up the program o
] the disk, then change the 00 back to 61.....

Again - what if folks don't have the required software/know-how!?

] NOTE: most and if not all Boot Sector Virus protection programs are VIRUSES
] in them selves, as they will copy them selves to other disks....

AFAIK only ONE anti-virus copies itself, which is the one that displays
the "This virus will flash the screen if it detects an executable boot-
sector, you can remove this virus by pressing reset". There are 3 versions
of this virus. A non-copying one, a copying english version, and a
copying german version. Both copying versions will _not_ overwrite
executable boot-sectors however!

] I have never had major problems with Viruses, and I see no point in spendin
] money on Virus check programs....

So you don't know what kind of annoyances they are, and what damage they
can do!

] NOTE: A valid floppy boot sector is when all the bytes add up to 1234 as a
] check, pad bytes are added at the end of the boot sector to get a val
] boot sector, so changing any byte would make the boot sector invalid.

Fat lot of use that is to the poor blighter who had his software destroyed
when a virus over-wrote the bootsector booter for it....

Write-protecting every disk isn't practical in many cases. The only decent
way to check for viruses is to download something like V-Killer (v3.84)
and check any new disks recieved. If the disk is supposed to boot, then
fine. If not, then using the "Test Kill" feature will render it non-
executable. If the disk then fails to work, then you can make it executable
again..... Quite a good feature this, basically, if the disk doesn't
need a booter, then clear the boot-sector and perhaps stick the
"Virus Free Disk" bootsector message onto it so you know for sure....

2236. Re: .PRG compresser/decompresser

You can also use Jam Packer - it's shareware and offers 4 types of compression. It can also be configured to remove any packing messages, etc.

2237. Change MIDI-buffer size on ST ?

Newsgroup: comp.sys.atari.st

Message-ID: <32mvm8$4ub@euas20.eua.ericsson.se>
Source record: 182182

Hi!

How do I change the size of the MIDI-buffer ?
I have used the bios (xbios ?) call Iorec which
returns a pointer to a struct where the size can
be *read*. However, how can it be written/changed ?
The default size is 128 bytes i think, and I would
need at least 1024 bytes.
I use Lattice C on a 1 meg ST.

Regards Mikael Hillborg

Hadn't heard of that one - thanks!

Just thought I'd post some results from a little informal test I did. I
compared compression of Pack-Ice 2.11, Pack 2.0 from Escape, BAPack from
Branch Always, PFX Pack, and Squish II. I compressed a 52kb program, and
found that the best compression came from BAPack, which reduced the program
very quickly to ~15kb, but the packed program would only produce two
bombs when I tried to run it on my TOS 2.06 MSTE. Next best was Pack-Ice,
which reduced the program to 39kb, but when the packed program was run, I
got two bombs again. Also, Pack-Ice was rediculously slow; it took
about ten minutes to compress the program. Squish II was next, with
reasonable compression time and reduced the file to 42kb in size. Just
behind Squish was PFXPack, which was about the same speed, and reduced the
file to 42.8kb. Finally came Pack 2.0 from Escape, which was extremely
fast but only compressed to a little over 43kb - less than 20%. Of all the
programs, PFXPack was reasonably easy to use, as was BAPack, but neither
offered uncompression (that I could see). Squish was by far the easiest to
use and had far more options than any of the others, including unpacking,
multiple levels of compression, batch opperations, and more.

I hope those of you who are looking for a program packer find this usefull.

Regards,
Tom

> Agree, but as long as we give the authors the money insted of spending
> them
> on transactions which will only benefit the banks, i have no problem with
> that.

A fee still gets sent to VISA via the transaction charge. Either way, money is being lost; the only distinction is whether it gets lost at the source or the destination.

> Exactly. And since you can't do anything about piracy, i think it's better
> to waste the time on those who perhaps will registre your software.

I can, however, at least make it somewhat difficult for the novice hackers to break into the program and distribute their own registered copies. I don't claim that my own protection scheme is at all brilliant; devious, perhaps, but it can be cracked -- and as I said, already has been from what I've been told. But anyway, that's beside the point.

> And then it's not a shareware product you released, but a demo version.
> Now
> you maybe start to see my point. If it's a demo version, there can be no
> pirates using it. And no matter if it's called a demo or shareware, you'll
> get the same amount of registred users. But the count of pirates will
> drop.

Changing its official standing isn't going to reduce the number of pirates there are. The fact is, a key is required to make it a full version; regardless of whether it's called "demo" or "shareware", it will still get cracked regardless; so long as there is the opportunity for a full version to be obtained without the need for registering, so the pirates will continue to crack software; I don't think they care how it's classified.

> A good idea is maybe to use UUCP insted. Offline reading/writing is much
> more easy to handle, and there's no time limits what so ever 8-)

I've done a bit of offline reading, but most of the time I just can't be bothered sitting around waiting for the packet to compress and get sent to me, et al. It would save me time, but then I also have to try and get back on the site too to upload my packet. And quite personally, I prefer to everything right then and there; that way, my replies are instant; there's no waiting for me to send up my REP packet. (Of course, not that anyone's hanging on my every word, naturally, but I just prefer to do everything online... I guess I'm just funny that way. :-)

Ah, yes. I didn't know MetaDOS took up so many cookies. (Normally, AFAIK,
TOS has 6 cookie slots available)

Perhaps you should try out ExtenDOS ... it's a new CD-ROM driver from an
author right here in Ontario ... it's supposed to be infinitely better than
Atari's MetaDOS.

I'd recommend mine (of course).... it is very very fast at JPEG's (at least the registered version is) and is a serious archive maintenance tool (I need it to be to handle my 100M of JPEG's....)

JPEGV220.ZIP is available from Umich and it's mirrors. JPEGV222.ZIP should be available within a week or two.

I wrote an MT-32 editor a few years ago. It is shareware (guideline:
$10), which you should be able to use for the MT-32 part of the
sound canvas as well. It is available on ftp.cs.ruu.nl. I can't
give you the exact path, as ftp.cs.ruu.nl seems hard to reach this
morning. It is called MT30TWO or something along those lines...

If you are having trouble getting it, I could send it to you
by e-mail.

Don't worry about the $10. Amounts like that are hard to get over
from nz to nl... :-)

Yes, there is a PGP for the Atari.

You may get it from:

micros.hensa.ac.uk, under micros/atari/tos/n/n192/

This is version 2.3a of PGP. I am looking into putting v2.6 on-line,
after seeing what the conditions are, as I think that 2.6 can only be
distributed in the US.....

There is also a GEM-Shell to use with this, called PGP-Shell, now at
version 0.9

This can be got from the same site, under micros/atari/tos/n/n193/

I support the Shell in the UK, and collect shareware for it...

Hope this helps

2254. Shareware solutions

Newsgroup: comp.sys.atari.st
Date: 1994-08-15 10:27:56 UTC
From: teler@bagel.cs.huji.ac.il
Message-ID: <32nfvc$4vl@pretzel.cs.huji.ac.il>
Source record: 182102

While I'm an Amiga owner, I sometimes read this group just to see what's happening with the Atari (us not-so-popular-computer owners should stick together).
Anyway, I've read these threads about shareware, and I have a few things to say.

First of all, a new idea is starting to be implemented for Amiga shareware, and this is having a shareware office, where people can send money to register. This company will then send the money to the author, once every so often (not on the acceptance of each registration).
The advantage of this is that a company can accept a credit card, or can convert foreign currency in one go, thus probably saving on bank fees.
Of course, it would cost a bit more to register, as the company will take some money in order to continue to operate, but such a fee would be small compared to what you have to pay in other methods, perhaps apart from cash (but this would be safer).
Such a system is especially effective when it's specific for a country.
You could then send checks in your own currency, and these will be converted and sent together. It should work well if there's a large enough number of shareware users willing to register.

As to the matter of crippled software, I agree that people need an incentive to register. One incentive which worked for me is the promise for free updates.
An annoying message could also be a good reminder to register.
I'm also against supplying a totally crippled version. IMHO it hurts the programmer, as few people will be willing to register a program they can't test.

I recently downloaded version 1.39g of the Before Dawn screen saver (DAWN139E.LZH).

However this is a german version but it says in the docs that a version with english docs is available as DAWN139E.LZH. Searching for this file via ARCHIE has unfortunately drawn a blank.

Has anyone any idea where I can find this file, please?

Thanks in anticipation ... Steve (ps1908@scitsc.wlv.ac.uk)

Hi All,

Does anyone know where I can get a program for the ST, once sold by Dr T, that Resynthesises midi data ? Apparently it could take S900 sample data and send it to a Kawai K5, amongst other things.

I don't know what it is called, but I *DO* know that it exists.

Can anyone help ?......or if you have ANYTHING for the Kawai K5, PLEASE drop me a line.

Many thanks.

>above version 2, though. Has your copy been corrupted during the
>download?
No, it unziped fine on the HP but not on my ST. So what i did was
just take the seperate files home instead of the zip file.
Now i have only one problem left, those program's work all in
color! Oops i forget to tell that, it should be for b/w monitors.
I working on the latest version of gemview now, i think that one
supports b/w monitors. (At least version 1.0 does)

>images. I'll try to see if I can find out what is wrong with the display.

Thanks, as I said, everything in SOL works just fine except for the display function, the dialogues come up properly centered and the correct size, the menu's work fine, but when it switches to the "full-screen" display it runs amok...

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's 'Statistics of Deadly Quarrels'. You've probably never heard of it even though its relevance to the mess you're in is at least as great as that of Darwin's 'On the Origin of Species,' which you learned about in fourth grade. And that's because it's so completely terrifying only those 'experts' who are adequately armoured with preconceived contrary ideas which will enable them to disregard Richardson's work completely ever get to study it."
- Chad C. Mulligan

2261. Atari software, Spectre GCR for sale!

Hello! I have the following items for sale or trade:

"productivity stuff"
Codehead Utilities, release 3.....$10.
G+PLUS 1.3.....$15.
MultiDESK 2.1.....$15.
Beckmeyer HARD DISK SENTRY 1.1.....$5.
Mini Office (Nicely done graphs and stuff, from UK) .....$25.
Spectre GCR 3.0 complete with system software and a big bunch of disks of utilities and programs to get you started.....$200.

"fun stuff"
OIDS and PINBALL MAGIC (games).....both for.....$15.

"books"
THE GUIDE TO CALAMUS DESKTOP PUBLISHING.....$25.
ATARI ST INTERNALS.....$10.

Or.. how about..... All for $250.

Add $2.90 for shipping, or shipping is FREE with three or more items!
Payment forms acceptable are Check, MO, or trade for any of the items below.
I am looking for Tracker/ST, STeno, Studio Photo, Imagecopy 2, True paint, Warp
9 v3.80, or EdHak or who-knows-what. Let me know what you have! (please legal only, with disks and docs) Call (303)473-0511 or EMAIL to JApolis@nyx.cs.du.edu or jeffApolis@aol.com

Thanks!

2262. Need to Switch drives A & B, quick!

Newsgroup: comp.sys.atari.st
Date: 1994-08-15 12:21:36 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <32nmkg$oh9@charm.magnus.acs.ohio-state.edu>
Source record: 182106
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Arrghhh! Well, first time I've ever had any problems with Diamond Edge... It seems to have trashed my hard-driver (ICD). No crash or anything like that, it ran fine, but upon restart my machine bombs (3) as soon as it hits the hard drive. Well, no big deal, I've had to reinstall the driver with HDUTILS.PRG before, a simple process, *BUT* (here's the fun part), my drive "A" is dead, I can get to the desktop fine (just ROMS), run ICDBOOT (or whatever that is called) to let TOS know I have something attatched to the SCSI port, and then run HDUTILS all from drive B. *BUT* everything works fine until I get to the critical stage; I've sellected to install the driver on drive "C", and "wham" the killer dialogue pops up "Please insert ICD utilities disk or other disk with 'xxxxxx' in the Auto folder of DRIVE A". Arrgggggghhhhhhh! @#$%^&*^%$#$%^$%^$^&&%#$&^#@!&&*)&%^&$ Nothing I can do will make ICD understand that I have that in drive B. So, I need to switch the drives. Now, I can't physically switch them, because the external drive is an old "Master"(?) drive and the cabling inside is somewhat different. Also, I'm not sure that it is actually drive A that is bad and not the cabling between the drive and the motherboard or powersupply. I understand that, however, it is possible to switch these drives either through software or through a small mod to the motherboard somewhere... Anyone with knowledge of this????

Any help would be greatly appriciated!

Thanks,

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

2263. v08INF2: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1994-08-15 12:33:59 UTC
From: avg@cwi.nl
Message-ID: <CuKtKn.FKs@cwi.nl>
Source record: 182107
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 8, Info 2

This article is posted regularly. It gives a short introduction to comp.sources.atari.st and describes how to submit sources or digressions to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.sources.atari.st

The moderated usenet group comp.sources.atari.st contains publications or announcements of sources and texts about programming for Atari TOS computers. The publications on comp.sources.atari.st may be freely distributed as long as modifications are documented and the original authors are mentioned.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a

while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "sources". The source postings are also called "Issues". For a while, 'announcements' were also accepted, but there is now a dedicated group, comp.sys.atari.announce, for that purpose. The type of a posting can be distinguished by the subject line:

Subject: v02INF1: Introduction to comp.sources.atari.st

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

Subject: v06i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler

OSS - OSS Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
zoo-high - program is archived (Zoo 2.1 required to unpack)
lharc - program is archived (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 6, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

: shareware users willing to register.

There is already something similar in the Atari world.....not a
company, but a group of individuals who do this.....Joe Connor, Graeme
Rutt, and Me!

We all support different programs, and have links with the respective
authors of the programs which we support in the UK. With me, people
send me the registration fee in Pounds, and I collect a few before
sending the author his ShareWare fees.

If anyone wants to send money abroad, then they can/may through
me.....just contact me first, and we can sort it out...I will have to
charge around 2 -3 pounds more than the asking fees, due to conversion
commisions, etc....or I will be out of pocket....I'm sure you lot
understand.

: As to the matter of crippled software, I agree that people need an incentive
: to register. One incentive which worked for me is the promise for free updates.
: An annoying message could also be a good reminder to register.
: I'm also against supplying a totally crippled version. IMHO it hurts the
: programmer, as few people will be willing to register a program they can't
: test.

I am all for crippled software, as long as the program is useable, and
allows me to see what the program is capable of....for eg, one of the
programs I support, a guitar reference, only has 5 scales, and 1 tuning
in the unregistered version....the full version has loads more than
that....this shows what the program can do, and is also an incentive
for the user to register...he/she'll get more. I also think that people
need to be nagged....something like MasterBrowse (again, I support this

in the UK), everytime you need to view a file, in the unreg version, a nag screen pops up....The registered version get's rid of this, and is also faster and personalised. Look at Flash II.....you are only allowed 40 minutes on-line, and it only allows you to download a max of 50 K.....you can see what the prog is like, and there is an incentive to regsiter....

2265. change floppy drive ??

Newsgroup: comp.sys.atari.st
Date: 1994-08-15 12:59:03 UTC
From: hhakkine@cs.joensuu.fi
Message-ID: <1994Aug15.125903.16476@cs.joensuu.fi>
Source record: 182109

The old floppy drive was a s/s Sony MP-F11W-5DU.
I read that ST has used Chinon F-354-C d/s sometimes and
try to fit a Chinon FB-354 d/s into it.

Do you know if those Chinons are alike ? The wires plug in fine but
the new drive never stops... it just keeps on running and for some
reason will not read the disk.
Could it be the OS (TOS 1.0) which matters ? Or should I change
some wires or perhaps turn it around or so ? I don't dare to try that
without some advice from wiser people - so if you have an idea about
these drives, would you please tell your opinion !

Hannu.

Supra hasn't updated the soft ware for a long time but it works very
well and it's free it does suport big partitions , and what do you mean by
get a copy of the ICD utils? Most people would have to bye it.

2269. Spice via ftp?

Newsgroup: comp.sys.atari.st
Date: 1994-08-15 14:46:31 UTC
From: andrewc@cogs.susx.ac.uk
Message-ID: <32nv47$rge@infa.central.susx.ac.uk>

>and fix...

Speaking of rubbish... ;-)
^^
Hard drive boot sector viruses _do_ exist, at least for other platforms.
I don't know why the Atari should be any different but not knowing any
specific ST examples, I won't claim otherwise.

>Viruses can't write to a write protected disk, its that simple...!!!

That's what I used to think, until I witnessed a demonstration of a 'key'
virus install itself from an infected hard drive to a physically LOCKED
floppy disk. This was at an ACE-NSW (Atari) user group meeting in Sydney.
The virus was transferred to the floppy with a directory update (Escape)
which, of course, is _supposed_ to be just a read-only operation.

After all, on the Atari (and most other systems, I believe) the write
protect notch on a floppy is simply a 'window' to a beam of light which
passes through it to a sensor. The point being that this is just a matter
of electronics, not a physical barrier to writing to the disk.

And no, I'm not selling Virus Killers and I'm not a teenager... I WISH! :)

With most drive mechanisms, the light sensor cannot be overridden. In other words, the machine asks to write, and the drive will either succeed or return an error. In such cases, the machine cannot directly control write protection, and the write protect notch can be considered a physical barrier unless the drive itself is modified in hardware.

That said, I have heard of some exceptions myself, on early Atari ST and PC 3.5" floppy drives. I think such problems had been solved by the time HD floppies were popular, so if a floppy is of that vintage it should be OK.

As far as viruses go, perhaps a decent suggestion (for someone who is trying to decide if he/she should spend the bucks on UVK or something) is to grab a copy of vkiller from atari.archive.umich.edu and check how many floppies have viruses already. I would bet that most ST owners have some occurances of the Signum (or Key) virus. Vkiller is freely available, so this test won't cost any bucks. I'll bet that a lot of people who try this for the first time will be shocked!

Lots of folks think they are safe because they don't "hang out with that crowd". Well, viruses have been spread via original commercial disks on numerous occasions, and anything that comes in a .MSA file could contain a virus as well. It is amazing how fast they spread. I consider myself fairly paranoid about such things (occupational hazard). I wiped out all my viruses years ago when Vkiller was first released, and have been checking new disks with it since, and I STILL managed to be reinfested with the Signum virus on a bunch of disks! This particular virus is everywhere in the ST world. We are particularly fortunate that it is "mostly harmless", in that it does not contain a payload, nor (I believe) will it overwrite an existing bootsector. BTW, it does not work on TOS 2.0x machines, so if you have a bunch of disks that don't boot correctly in MegaSTEs, you may now know the problem :-).

A few years ago I came across a program called "ProShare ST" by "TC Develpments", a UK based company. It was a stock market analysis program for the ST and was pretty good too.

Anyway, I'm looking for the author of the program who's called Andrew Brown. Does anyone know his current where-abouts or, if he's got one, his e-mail address?

Thanks in advance...

Mike Davis.

>
> Oh yeah, my system consists of a TOS 4.04 Falcon 4MB/85MB + NVDI+Blowup030
> Hard I.

Ludo says: I have Falcon, 4.04, 2*85 MB, 14 Mb, NVDI 2.51 and screenblaster II
and have no problem with speedo (I have 4.21) AND NVDI. Only Atari Works
doensn't print all the time (errors in upper line of screen, should be a
message box but isn't)... As for the system font replacement, I used some
other program to fix that, but I can't remember the name.. Sorry (it was old
though). The config file does only have to contain your gemsys path and
(screen and printer drivers), the rest is not usefull. Speedo does this all
using other *.SYS files.
(unless you still want to use pixelfonts in stead of speedo)

Hopefully helped you,
L.J.Sak@Kub.NL

2276. Q: patches for MiNT 1.10

Newsgroup: comp.sys.atari.st
Date: 1994-08-15 16:08:15 UTC
From: joris@Belgium.EU.net
Message-ID: <CuL3Hr.GGA@Belgium.EU.net>
Source record: 182119

Scanning through this newsgroup, I regularly find references to MiNT 1.10hX with the X some number. I assume that these are patched up versions of the MiNT 1.10 found in the a.a.u.e archive or its UK mirror. Where can I find these patches ? I have some problems with my version 1.10 (occasionaly it crashes with a message indicating that some memory area was not allocated when the system tried to deallocate it) and maybe there exists a patch that solves this.

Joris.

2277. Which C-compiler to use?

Newsgroup: comp.sys.atari.st
Date: 1994-08-15 16:12:26 UTC
From: sanders@sci.kun.nl
Message-ID: <CuL3os.xD@sci.kun.nl>
Source record: 182122
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all,

A recent posting about GCC complained about the almost doubled exec size, compared to Lattice C. Now I know there was a C-compiler-thread some time ago, but I'd like to ask it again: What C-compiler is best to use on an Atari? A few years ago it was Turbo C that won on all points: Fastest compile times, shortest code, fastest code, best help system. So when I decided to have a go at C, I bought Turbo C 2.0, and I'm very pleased with it. Now I thought that GCC (which I use at uni for my programming assignments) was unbeatable with respect to the code it generates, and had only drawbacks concerning memory requirements. Now this story about the large exec size maked me wonder again, what to do if I master C enough to start doing serious work. Should I download GCC and spend a holiday setting it up, should I buy Lattice C (which is quite expensive for a student), or can I keep on using Turbo C? My original dream-world was to use Turbo C for developing, and GCC the final source. Now, in the days of MultiTOS, I can imagine developing with GCC is not that bad anymore, with multiple man-pages on screen, compilation in the background and an editor window, but I am very much against PC-style, unneccesary huge execs.

Help me out, please. What do you use, and why?

Thanks in advance,

Just write a new value to the same positions (but if you select
a larger buffer-size, you must also set a new buffer-adress that
points to a allocated buffer, and set the water-mark right).

According to Steinberg, the files should be compatible _but_ I
recommend that you try it out first, because Atari-versions
are technically ahead of PC-versions, and lower versions do not
accept .ALL:s from higher versions (.ARR, .DRM & .PRT should
be accepted by lower versions, if you edit out the extra bits
as notation layout data in List Edit).

If the drive doesn't stop spinning and the drive activity LED lights up
constantly it is very likely that you have the cable upside down....
I suggest you turn it around as quickly as possible, otherwise you may
damage your sound-chip which supplies the drive select and side select
signals (these are NOT open collector outputs).

FC> closure of STF help the Atari market? Actually, I'd be interested to
FC> hear why you think the mag is crap, and when was the last time you
FC> bought an issue?

If STF closed down maybe more people would buy ST Review instead, and actually get to read something useful for a change. :-)

Seriously though, I don't know which magazine will go down first but one of them will, that's for sure. The declining Atari market can't support all three UK magazines much longer. Remember what happened to the German magazines not long ago. But I hope ST Review will be the last one to go because it's the best!

Hi, Roger! On 15 Aug 94, you wrote:

RS> From: sheppard_r@kosmos.wcc.govt.nz (Roger Sheppard.)
RS>
RS> I see there is a lot of rubish being posted about Viruses,
RS> ither from people that have vested intrest in selling Virus Killers
RS> or teenagers that just don't know....

What's your excuse then? :-)

RS> There are NO Keyboard buffer viruses, no Hard Drive boot sector
RS> Viruses, there are some Floppy bootsector viruses, but they are very
RS> simple to detect and fix...

Unless it just happened to infest the bootsectors of your original game disks,
which could put you in some serious trouble without a good virus killer.

RS> A boot sector Virus is as it states, it installs its self ONLY on
RS> boot up, so checking disks for valid boot sectors is all that is
RS> needed, but you must boot your Atari with out a disk first, or with a
RS> know Virus free disk..

That's where a virus killer comes in handy.

RS> Viruses can't write to a write protected disk, its that
RS> simple...!!!

True, but neither can any other program!

RS> Virus check programs wipe the hole boot sector, so be warned, you
RS> can't recover them...

Unless you use a professional virus killer like UVK.

RS> NOTE: most and if not all Boot Sector Virus protection programs are
RS> VIRUSES in them selves, as they will copy them selves to other
RS> disks....

Only if requested by the user as a means of identifying a clean disk. You will
then immediately recognise if the boot sector has been altered since the last
time you checked it. Any virus killer that assumes it can write to the boot
sector without asking the user first should be trashed.

RS> When playing (Booting) with unknown floppy disks, Turn of your Hard
RS> drive, or dissable the booting of the hard disk, a Ship program can
RS> turn off internal hard drives...

My poor harddisk would take a hell of a beating if I switched it off every time
I inserted a new disk. The real danger is if the virus is spread by some

executable program on the disk, in which case it won't matter if you take this precaution or not. I pray there's no such programs!

RS> I have never had major problems with Viruses, and I see no point in
RS> spending money on Virus check programs....

I have never had any serious problems, although I've had my outbreaks of bootsector viruses in the past. But I see the point in investing a few dollars for my own protection. There's no way you can loose really.

RS> NOTE: The bigest Virus for STE's users is the old DMA chip, it has
RS> stuffed up 2 Hard Drives for me....

What about link viruses? Do they exist?

I did here about this one it turned out they had a faulty disk drive,
the had a broken wire..

The disk controler chip does not allow writing to a protected disk, I have
heared that the Amiga system can write to a write protected disk as they
don't use a disk controler chip, but to custom IC's for floppy support...

2296. Running Accessories as Programs

Newsgroup: comp.sys.atari.st
Date: 1994-08-16 01:10:29 UTC
From: scotty@cais2.cais.com
Message-ID: <32p3m5$rga@news.cais.com>
Source record: 182136

Hi all,

I read the csast faq and didn't see this, although I know it has come up before...

I've heard that you can run an accessory by clicking on it from the new versions of the desktop with MultiTOS. What I tried first was changing the line in gem.cnf that starts with "setenv GEMEXT=" by adding "ACC" to the list.
This did not work.
The next thing I did was edit my newdesk.inf file, and added a line that contains
#G 03 FF 000 *.ACC@ @ @
This worked. It duplicates the lines that list .PRG and .GTP, so it makes a certain amount of sense.

However, this doesn't work only under MultiTOS, and it doesn't work with every accessory. I've fooled GEM, but I don't think this is the mechanism intended for the purpose. I couldn't get ImageCopy to run at all.

So what is the right way? The Atari books claim that you can run .ACC files just by clicking on them, but that's plain wrong on my system, at least the way it came configured...

Thanks for any help. Sorry to those who have seen this too often; it ought to get into the FAQ list.

The world's most pervasive and damaging virus is produced by a company
owned by a guy named "Gates" who thinks he's a god of some sort. It's
called DOS, and it comes with a companion program called "Windoze" and
it has now copied itself to hundreds of millions of machines.

And very few people seem to know this obvious Truth...

2299. Re: The future of Atari Computers

Newsgroup: comp.sys.atari.st
Date: 1994-08-16 04:53:54 UTC
From: Graham.Irvine@mettav.exnet.com
Message-ID: <777005226.0@mettav.exnet>
Source record: 182099

It was none other than Mark Adami that wrote on 11 Aug 94 that ,

MA> If Atari could come up with a computer that has:
MA>
MA> - A fast and modern processor,

Like a Falcon with an Afterburner Board you mean ? (Although for me my 32Mhz Falcon 030 is quite modern enough ATM)

MA> - Graphics and sound capabilities of the Jaguar,

Which certainly (Afterburner) has an expansion port for a graphics Card.

MA> - An OS that can multi-task and provide a stable and conformant
MA> good-looking environment like the Mac, but can also be told
MA> to request all running processes to terminate and then
MA> dissapear itself so that a game can completely take over

You'll be talking about MAG!X then ... I used it on the ST and loved it , on the Falcon it should be absolutely dynamite !

MA> the system; and also (I hate to sat it) run windows
MA> software,

Is the 486 Falcon speed still in the pipeline ? The only conceivable reason to want to use any other machine IMHO is for a particaular peice of software but look only yesterday I am reading a message from a MAC convert who wants to see an ST emulator ... mmmmm !

MA> then, I think they would be on to a winner.

By the end of the year (or RSN <grin>) all your requirements should be fulfilled I'd say ,but a winner ....nope . We are talking a massive market installed for other machines and a superior machine ain't going to dislodge that just because it is so. But do I care ,again a resounding NO because I have a machine I feel comfortable with and moreover at a speed and manner that suits ME. Not for me the 500 page manual ..how to install Windows properly :-)...and then the countless other manuals,courses etc explaining it all over again to everyone.

It was none other than Jack Kitowicz that wrote on 9 Aug 94 that ,
JK> I have both NVDI and SPEEDO4.2 installed (along with the drivers
JK> aoutline accesories) but if NVDI is on the I cant use my Speedo
JK> fonts. Could someone than has both working together send me their
JK> config files? (assign.sys and any tips you have for fixing the
JK> problem?) thanks a lot

I would like to hear offerings on this , I doesn't even know if they will work together ! For starters I'd switch NVDI GDOS off :-) But I haven't experimented with anything else.

JK> Also, can anyone tell me how to install a new system font with NVDI?
JK> Every time I cange the assign.sys file from the regular font it
JK> ignores my changes and doesn't do anything.

You have to put an <s> before the font but I haven't got round to working out which screen.sys goes with each Falcon resolution yet OR where overscanned and BlownUP resolutions come into the equation.

My old ST setup seems to work though ;

```
path = c:\gemsys
01p screen.sys ; DEFAULT
S monaco08.fnt
02p screen.sys ; ST Low
03p screen.sys ; ST Medium
04p screen.sys ; ST High
S monaco08.fnt
05p screen.sys ; TT Low
06p screen.sys ; TT Medium
07p screen.sys ; ???
08p screen.sys ; TT High
21 printer.sys
```

Yes, there are big-time problems in doing a PostScript driver. It just doesn't fit into the GDOS scheme of things. However, we're going to try to do one anyway. We've implemented PostScript into many of our other software packages - we think it's important - and we want to see it in SpeedoGDOS. But it will take some time. I don't have a release date or anything, we're just getting going on this.

>I understand icd make an accelerator board for the st. How much are

>these, are they compatible with most (all) software ?

Best bet is call ICD! The Adsci Micro ST Kit (allyou need to put a 3.5"
hard drive inside your mega ST is on closeout sale for $39.95)
I have the Adaspeed STe installed and the only thing I have lost the use
of is the software to display SPC's and Neither Photochrome or it's PCS
viewer will display properly (timing is off) won't even work in 8Mhz mode!
Speed of Light still works though! As of right now those are the only things
that I am sure no longer work. Steel Empire and Elite II (Frontier) move a
heckof a lot quicker and the speed up is pretty apparent with lot of stuff!
For $99.95 you can't go far wrong! Phone no in US is (815)968-2228 Fax is
(815)968-6888 Only problem is You have to call during working hour Central
Standard Time.

Robert, that is good news!

I don't quite understand why PS doesn't fit into the 'GDOS scheme of
things' -- could you elaborate please?

Will the driver work only with Speedo 5, or will it work with NVDI 3
as well? :-)

One of the best places to get ST stuff via FTP is
atari.archive.umich.edu in the /atari/ directory.

If you have a 256K 260ST, though, keep in mind a
LOT of stuff requires 512K or 1MB to run.

: FC> Whether you like STF or not, surely you can't believe that the
: FC> closure of /any/ ST mag will help the current situation? I respect
: FC> your opinion in that you don't like the magazine, but how could the
: FC> closure of STF help the Atari market? Actually, I'd be interested to
: FC> hear why you think the mag is crap, and when was the last time you
: FC> bought an issue?

: If STF closed down maybe more people would buy ST Review instead, and actually
: get to read something useful for a change. :-)

: Seriously though, I don't know which magazine will go down first but one of
: them will, that's for sure. The declining Atari market can't support all three
: UK magazines much longer. Remember what happened to the German magazines not
: long ago. But I hope ST Review will be the last one to go because it's the
: best!

Seems to me like Patrick's talking a bag of shite. People buy magazines
on their own merit and not because "I can only afford one, the best
one..." - get a grip!!

I personally buy a magazine based on quality, that of the reviews,
advice column, coverdisk and features. If the three U.K. mags are worth
buying in one month, then i'll buy all three.

They all seem to cover something different each month, and regularly
look through my large selection of back issues for that little piece of
Calamus SL advice that wasn't of any use back then, but now....

If you think that any of the magazines are crap, then they're wasted on
you - there's no way on earth that you justifiably call any one of them
crap. Just beacause you might not like a particular issues' contents is
no excuse to slag of the journalistic capabilities of the editorial
staff. I've been buying STF, STR and STU for the last 2 years or more,
have missed only a few issues and to be honest have never (i) been moved
to say that the author of a feature was crap, or (ii) found any
fundamental difference in journalistic styles!!!!!

A personal view, gleened from reading the NET, is that the ST market is
long from dead, and possibly even reviving. Over the last year or so,
the range and quality of new software has been amazing and as long as
this is the case (which is for a good while yet), there will be plenty
of room for the three good magazines to operate.

Keep up the good work editorial staff.

Patrick, get a life.....or learn to read the articles rather
than just looking at the pictures!!!

Steven.

h> Do you know if those Chinons are alike ? The wires plug in fine but
h> the new drive never stops... it just keeps on running and for some
h> reason will not read the disk.

Make sure the drive is set as drive 0 just like the original internal drive
was. Atari's are a bit strange that instead of using the two drive select
lines to support 4 drives (00=1, 01=2, 10=3 & 11=4) they only support two
drives. These lines are physically swapped around between internal and
external (01=internal & 10=external).

Both and internal drive and external drive must be set to be drive 1. It
sounds to me that the drive recognises that there's disk activity so spins up
but isn't selected for read/write.

h> Could it be the OS (TOS 1.0) which matters ? Or should I change
h> some wires or perhaps turn it around or so ? I don't dare to try
h> that without some advice from wiser people - so if you have an idea
h> about these drives, would you please tell your opinion !

Just check the drive number. Failing that, then something else is dodgy!

ATB,
Karl.

: John W.

I think the situation is that it is illegal to export it out of the US, the legal situation as regards downloading it from a US site is a little fuzzy because the export restriction is of course only a US law. Most sites in the US require evidence (verified US email address) of US citizenship before they will allow you to download it so _they_ don't get prosecuted for allowing it to be exported.

I'm not sure if this is entirely right but it's all I can remember of hand.

Mike.

In article <32mec1$r36@golem.wcc.govt.nz>, sheppard_r@kosmos.wcc.govt.nz (Roger Sheppard.) says:
>NOTE: A valid floppy boot sector is when all the bytes add up to 1234 as a sum
> check, pad bytes are added at the end of the boot sector to get a valid
> boot sector, so changing any byte would make the boot sector invalid...

Note that the 1234 checksum is only necessary for a boot sector that is EXECUTEABLE - therefore changing any byte of an unexecuteable boot sector does NOT invalidate it. Changing a byte on an executeable boot sector will have the effect of making it non-executeable. Anyway its easy enough to change the bytes and recalculate the pad bytes to restore the 1234 checksum.

BUT changing bytes willy-nilly may also mess the disk up - the boot sector contains info re. the disks characteristics (tracks/sectors per track/etc) and if this info does not correspond with the REAL setup then **!"$"!.

Spice can be found at a number of ftp sites

ftp.cs.ruu.nl /misc/spice.zoo
ftp.uni-paderborn.de /anwender/spice.lzh
ftp.uni-stuttgart.de pub/systems/atari/applications/science/spice.lzh

There is also a demo of a graphic front end called Spiceline 1.3 which looks
pretty good. I think there are ordering details in the docs with the demo.

ftp.tu-clausthal.de spicln_e.lzh
src.doc.ic.ac.uk computing/systems/atari/umich/Graphics/spicln_e.lzh
ftp.uni-stuttgart.de pub/systems/atari/applications/science/spicelin.lzh
ftp.uni-paderborn.de /misc/demo/spicline.lzh

After you have un-archived spice, there will be a file called prl.tos
This needs to be run before running spice as it sets up the libraries.

Happy simulating

2318. ? ICD sgaa continues

Newsgroup: comp.sys.atari.st
Date: 1994-08-16 11:06:56 UTC
From: robinp@sherwood.uk.sun.com
Message-ID: <32q6kg$5c2@uk-usenet.uk.sun.com>
Source record: 182063

I have recently installed an ICD SCSI host adapter for my 1040STe

I cannot get it to work properly - even though I have tried different disks,
An embedded SCSI Quantum 105MB, and a Micropolis 1335 (142MB) with an Emulex MD21
SCSI controller, amongst others (I am fortunate enough to be able to experiment
with various disks).

The problem(s) I have are :

(1) when I run the installer program, the disk is formatted and partitioned and FATs
etc are written BUT the set of AutoBoot fails:

Sense Code: $00
TOS Error: -10
Operation: Set AutoBoot

Sometimes I get:

Sense Code: $00
TOS Error: -8
Operation: Set AutoBoot

If I just format/partition (using default GEM partitions) and then do a manual
Set AutoBoot from the HDUTILS then I usually get :

Sense Code: $00
TOS Error: -12
Operation: Verify (Data Mismatch)

(2) Ignoring the AutoBoot stuff, if I just format/partition (using default GEM
partitions) and then define the disk partitions, I can see them and write/read
to them but the data disappears on the next boot. In fact what is worse, is that
partitions disappear each time I use the DESKTOP utility program until eventually
it does not display any partitions at all !

In an earlier email I was told that I "may have one of the flaky DMA chips" - Is this
a common problem, has anybody else had this ?

Has anybody any ideas ?

How about a list of TOS error messages ?

Thanks,
Robin Peatfield.

Yes.
That's right......but I think that cost has something to do with it as well. During my student days, I used to get STF, and STU. I wanted to get ST Apps, too, but couldn't afford it...especially, as you had to pay in advance for 12 issues. Then came ST Review...and I liked that, too, but found that STF, and STU were good enough, and as I had been buying them for a long time, I thought I might as well carry on with them, instead of changing and going onto another mag. I did want to buy STR, too...but couldn't afford it.

Now that I am working...I get all 4 mags...every single month...without fail.

: If you think that any of the magazines are crap, then they're wasted on

: fundamental difference in journalistic styles!!!!!

None of the magazines are crap.....I do agree with you Steve, but I do have my favourites, and not so favourite ones....

STF is one of my not so favourite ones....not because the content is crap or anything...just that the content is not geared toward the type of user that I am....STR and STA are more my type of mag. STF is good at what it does....upto now, it was mainly games coverage.....geared toward users who are in the 12 -16 age group (IMHO). However, over the past 2 months, STF has been getting better, and has nicer reviews...the one which I was angry about was the one in which they featured MAG!X (MagiC, now), and that issue had loads of spelling mistakes....how this got past the editor, I do not know!

But STF is getting better, and is, I think, starting to cater for a wider taste....I would like to write/contribute to STF too...it has a wider distribution than STU and STR put together (from the same publisher). I write for STR at the mo (and also STA)....

I will still carry on buying STF, as long as it stays good at what it does, and curbs down on the spelling mistakes ;-> I too, like to see different viewpoints on things Atari...and the best way is to read the different mags.

Dan.

fr> hear why you think the mag is crap, and when was the last time you
fr> bought an issue?

OK, OK, so I admit I was a little irate on the day I wrote that and perhaps the language was a bit OTT. However, I *still* believe that ST Format is a very poor magazine. For what you pay...it's just outrageous. I regularly look at it on the newsagent's shelf to see if it has become better, but every time the answer is no. All that happens is the price goes up for the same rubbish.

I used to buy STF regularly, then they brought in the 'Cover Disk' thing, and forced me to pay loads more for a disk that I didn't want, or need. Invariably, it is the same old stuff appearing on there anyway. Go back through your old STF cover disks and check for duplicates. It may not be the exact same program, but it will perform the exact same function, and will probably only be a demo anyway. I have *never* used anything from the cover disks more than once. I object to having no choice in the matter. They did, once upon a time, give readers the choice of cover disk or no cover disk, but that's gone too.

Cover disk aside, the content of the magazine is weak. STF has always been one of the 'games' type ST mags admittedly, but lately, there is virtually no substance to it. It is following the path of many a computer mag before it....the sales drop slowly, then more ads start appearing and eventually...phut. It is FULL of adverts & inane articles. I have not got as far as reading any games reviews, but I presume that the pretentious condecending manner of the reviewers still remains.

Also, I have written to STF on many occasion, when I actually used to *like* the magazine. I received not one reply, not one acknowledgement, nothing. That is just plain arrogant ignorance. Before you assume that my letters were of the same genre as this one, I can assure you that they were genuine & very polite, when I was naive enough to believe that a magazine cared about it's readers beyond what was in their wallets.

Apart from my personal gripes, I really believe that STF is, considering the ridiculous price, a very weak magazine. Maybe closure of it wouldn't help the ST, but then again, it is not really a magazine that decides the future of a computer system is it ? After all, the ST *is* an 'old' system, and it won't be long before it goes the way of the Dragon 32, the Spectrum, The QL, the BBC, etc etc etc. I like my ST, and I intend to upgrade it eventually, I want to put a HD on it & the new TOS etc etc. I like it because it is great for MIDI, and it's cheap. But, it WILL become obsolete eventually, and STF won't really make any difference to that chain of events.

I just think that STF is far too expensive and has an 'attitude' problem.

2323. v22INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1994-08-16 12:19:50 UTC
From: avg@cwi.nl
Message-ID: <CuMnL2.9JJ@cwi.nl>
Source record: 182065
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 22, Info 1

This article is posted sort of regularly. It gives a short introduction to comp.binaries.atari.st and describes how to submit binaries to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.binaries.atari.st

The moderated usenet group comp.binaries.atari.st contains publications or announcements of binary packages for Atari TOS computers. The publications on comp.binaries.atari.st may be freely distributed as long as no modifications are made to the packages. The packages may contain public domain software, shareware or demos of commercial programs.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.binaries.atari.st.

SUBMITTING BINARIES FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg. Note that comp.binaries.atari.st is not the correct place to ask general questions or to ask, "Does anyone have software that does X?" Post such requests to comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

If possible, submit your binaries in a Zoo 2.1 archive. I will generally check that everything in the archive is OK and that the files in the archive make sense on an ordinary Atari ST system (i.e. they are MS-DOS style files), unless the archive is specifically intended for use with an alternative file system such as Minixfs. If necessary, I will re-pack the binaries using Zoo 2.1.

If you are submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. But feel free to post demo versions. Submissions which I feel are of an excessively commercial nature will not be posted.

THE STRUCTURE OF COMP.BINARIES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "binaries". The binary postings are also called "Issues". The postings of type 'announcement' (history has only known 1) are no more supported, as we now have a group comp.sys.atari.announce for those. The type of a posting can be distinguished by the subject line:

Subject: v06INF1: Introduction to comp.binaries.atari.st

This first word in the title identifies this as the first info posting of volume six. Similarly, the subject line shown below:

Subject: v20i081 (binary): deadwrtr -- Ouija-word processor part01/01

identifies this as the 81st issue in Volume 20, and it's a binary posting. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v20i041 (binary): pet -- CBM PET emulator part04/39

The "References:" line, if present, points to the previous part of a multi- part program, so that newsreaders (trn, tin, nn, etc.) which can

follow threads will recognize a large program as a single thread.

The first few lines of an article's body are auxiliary headers that look like this:

```
Submitted-by: jackt@atari.com (Jack Tramiel)
Environment: high resolution, tt
Posting-number: Volume 19, Issue 80
Archive-name: rsn
Supersedes: atw: Volume 10, Issue 10-15
```

"Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site. This will usually be the same as the "From:" line in the article's main header.

Certain information about the system configuration required to use the program is given on the Environment: line.

```
Environment: 1meg, medium res, high res
```

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory. Examples:

```
high - runs in high resolution (monochrome)
medium - runs in medium resolution
low - runs in low resolution
1meg - needs 1 meg of RAM
ste - requires an STe
tt - requires a TT
```

The "Posting-number:" line repeats the volume/issue information for the aid of notes sites and automatic archiving programs.

The "Archive-name:" is the "official" name of this program in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

The "Supersedes:" header line, if present, indicates that the program replaces an earlier version.

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-by header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in
the posting (for instance, a font editor's documentation might refer to
some sample fonts), contact the submitter, not me. I post articles in
their entirety, so if it isn't posted, I probably don't have it.

2324. what to do with a 1040ST

Newsgroup: comp.sys.atari.st
Date: 1994-08-16 12:30:37 UTC
From: skj@oasis.icl.co.uk
Message-ID: <CuMo32.5J3@oasis.icl.co.uk>
Source record: 182070

Hi, I've just been given an *old* ST 1040, with mouse, joysticks, lots of disks and a laser printer. I am basically a PC person (486-OS2/486-Linux/ 586-Linux machines at home) and would like to get to grips with this beast. Firstly what sort of upgrades can I/ should I do ?, and where is the cheapest and or best place in the UK for ST stuff.

Is there any chance to upgrade such an old ST to a 68030 so I could have a go at the ST Linux port ???

Thanks for listening.

2326. Re: Running Accessories as Programs

Newsgroup: comp.sys.atari.st
Date: 1994-08-16 13:03:42 UTC
From: teh@unix.brighton.ac.uk
Message-ID: <1994Aug16.130342.6182@unix.brighton.ac.uk>
Source record: 182075

Unfortunately the desktop does not support this, only the OS does.
What you need is a little program that is installed as an application
for ACC or ACX, then when you double click on this program it loads and
executes the ACC {there is a new mode for exectuting a ACC to ditinguish
it from a program}.

I believe this program exists sOmEwHeRe!!!

Hope you find it

Tom.

I`m looking for a documentation about the communication between dsp and the host.
can somebody give me an example? i got motorola`s 56001 dsp examples, but they show only the dsp side and how to use them from the host (c-programm) side.

You can upgrade to a 68030 but you will need anew case. This start getting rather
expensive. What do you want to do with your ST? Program, use some Apps? A hard
disk would be a good start and maybe 4Mb of RAM (the nominal max on a 1040ST).
You could fairly cheaply up the processor to a faster 68K but a 68030 would cost
much more.

Hear is a file that might help :

--------------------------- snip -------------------------
ST DRIVE SWITCH
by Bill Pike (PAC)

If you have a 520ST or 1040ST with a internal drive that drive
is always DRIVE A and the external drive is DRIVE B. This is
fine until you want to boot a disk from the external drive or the
internal drive needs to go the the doctor. You are then up the
proverbial estuary without the necessary means of propulsion.
Anyhow I have added a switch to my 520ST that will switch the
drives making the external drive DRIVE A and the internal drive
DRIVE B. This allows you to select which drive will be your boot
drive and allows you to operate without a internal drive if
necessary. It will also allow you to switch drives, in mid-
stream if you have the disk in the wrong drive. You will have to
wait until the drive activity light goes out, meaning that the
computer is no-longer accessing a drive or you could bomb/kill
the disk.
DO NOT ATTEMPT THIS MODIFICATION UNLESS YOU HAVE DONE WORK ON
COMPUTER BOARDS BEFORE OR HAVE PREVIOUS EXPERIENCE WORKING ON
PRINTED CIRCUIT BOARDS AND IC CHIPS.
HERE IS THE NECESSARY DISCLAIMER: NEITHER THE AUTHOR OR THE
PORTLAND ATARI CLUB TAKES ANY RESPONSIBILITY FOR THE RESULTS OF
THIS MODIFICATION INCLUDING BOTH SOFTWARE AND/OR HARDWARE DAMAGE
IF THIS MODIFICATION IS PERFORMED. THIS MODIFICATION WILL ALSO
VOID ANY WARRANTY ON YOUR COMPUTER.
This modification has worked on quite a few computers that it
has been used on and the only problem seems to be that some
computers might try to write to the disk on boot up but I have
had no problem in this area. Anyhow you might want to write
protect your boot disks, this is a good idea anyway.
Now to the actual modification. You will need a Phillips

Screwdriver, a small slot head screwdriver, a set needle-nose pliers, a set of wire strippers, a set of diagonal cutters,a small soldering iron, de-soldering wick or a solder-sucker, and a 1/4" drill. That concludes the listing of the tools. Parts required are, a sub-miniature Double Pole/Double Throw switch, and about 3 ft. to number 26 or smaller hookup wire.
First the computer selects which drive is going to be used by the YAMAHA (YM2149F)chip labeled U-19. This is the I/O interface chip. The chip sets in the back-center of the board and is next to the RF Modulator which is a silver-rectangular box located just to the right of the center of the back section of the board.
Clear a fairly large area on a table and have good light, you will have things spread out over a fairly large area.
#1 disconnect all cables hooked to the computer and turn the computer over on its face with the bottom facing you and the keys next to you. You will see several screws (Phillips head) on the bottom. Remove these screws, three of them will be much longer than the others. Also keep separate, by length, screws that are the same and remember where they came from.
#2, slip your hand under the computer and hold the top and the keyboard in place. Then turn over the computer so that it is right-side up.
#3, carefully lift the top off the computer and set it aside. You will note that the keyboard is left on the computer.
#4, carefully lift the keyboard and note that it is attached to the computer by several wires and a plug on the right hand side. Carefully remove the plug from the computer board and set the keyboard aside.
#5, you now to remove the internal drive. There is a metal shield over the cables connecting the drive to the computer on the left side of the drive unit. There are one or two screws holding this small shield, remove these screws and remove the shield and set it aside. You will see a flat ribbon cable, with a plug on it, and several colored wires that go to a plug on the back of the drive. Carefully lift the right hand side of the drive, the side with the disk slot, slightly and then lift the drive and move it slightly to the right. You can then remove the flat ribbon cable by gently pulling on the plug connected to the drive. The other plug has a retainer as part of the jack that it goes into, this is a small pin on the jack that engages a small slot in the plug, lift this with a small slot head screwdriver and pull the plug gently loose.
#6, you now need to remove the Power Supply. There may be a small shield covering the wires connecting the Power Supply to the main board, remove the screws holding this shield and set it and it's screws aside. You may or may not have this shield on your computer. There is a small plug connecting the Power Supply to the main board, remove this plug. You may now lift the power supply clear and set it aside. Older models may not have a internal power supply.

#7, you will now see the RF Shield this is held in place by a series of twist clips along the edges. Twist each of these clips to line up with the slot that it is in then gently lift the shield. DON'T FORCE IT. Once you have the shield off set it aside. You are now able to remove the bottom shield by turning the main board over and removing the shield, do so. Turn the board back upright.
#8, now locate U-19, this is the fabled YAMAHA chip, this is a 40 pin chip with the label YM2149F on it. Inspect the chip, on one end you will see a dot on one corner, this indicates that the pin, leg, in that corner is number 1. Count down the pins, starting with that pin until you find pins 19 & 20, these should be the last pins on that side of the chip. VERIFY THAT THESE ARE PINS 19 & 20 UNTIL YOU ARE SURE. Now turn the board over and locate the same pins on the bottom of the board. VERIFY THIS UNTIL YOU ARE SURE.
#9, BE EXTREMELY CAREFUL AT THIS POINT YOU CAN EASILY LIFT A CONDUCTOR FROM THE BOARD. Now take your soldering iron and the solder-wick or solder-sucker and clean out the holes these pins go thru. Now take the needle nose pliers and gently loosen the pin from each hole. MAKE SURE THAT YOU LEAVE NO SOLDER SPLASHES OR BRIDGES ON THE BOARD.
#10, you will now need to drill a hole in the case to put the switch thru. I would suggest a spot between the printer (parallel) port and the external disk drive port. Check that you will have to drill thru the bottom shield just the plastic and that the switch will clear everything.
#11, Cut 2 pieces of wire and bare each end. Connect the outside pins of the switch together in the form of a X. Cut 4 lengths of wire 6 inches long and bare both ends. Bare both ends of each piece and solder these pieces to the center terminals and one set of end terminals, it makes no difference which end. Twist the wires that go to each pair of terminals together for identification.
#12, Install the switch.
#13, now back the the chip. Using the needle-nose pliers, from the top of the board gently lift the two pins (19 & 20) clear of the board and bring them out from the side of the chip. BE VERY CAREFUL YOU DON'T BREAK A PIN. DON'T BEND THEM TO MUCH, JUST ENOUGH TO CLEAR THE BOARD AND HAVE ROOM TO REACH THE HOLES THEY CAME OUT OF.
#14, cut the wires from the switch to reach to the pins of the U-19 chip and strip the ends. Then take one pair of wires and insert them thru the open holes, that you removed the pins from. Take the other pair of wires and solder them directly on the pins of the chip. Turn the board over and solder the wires that you poked thru the holes. Neaten up the wires. VERIFY ALL CONNECTIONS AND THAT NOTHING IS TOUCHING ANYTHING IT SHOULDN'T BE ALSO THAT THERE ARE NO SOLDER BRIDGES OR SPLASHES. THIS COMPLETES THE MODIFICATION.

#15, Repeat steps #7 thru #1 IN REVERSE ORDER to reassemble the computer.
#16, Connect the external drive to the computer and also connect the power and monitor. If the computer fails either of the next tests something is wrong, shut the computer down and re-check what you did. Turn the computer on and verify that the activity light on one of the drives comes on and that the screen display is normal. Turn the computer off and change the drive select switch. Turn the computer back on and verify the other drive activity light comes on and that the screen display is normal. If these tests are OK you have correctly installed the switch.

: get a copy of the ICD utils? Most people would have to bye it.

I did in fact buy it when I bought the SupraDrive. The problem WAS
that some of the files had been corrupted and I needed someone to
give me a fresh copy.

I got a VERY good response and I now have my disk drive working (almost)
perfectly. Just need to fit a new clock battery.

I would like to thank all those who helped very much. I will not name
anyone as, knowing my luck, I would probably miss out the person who
helped me most.

Again thanks all,

John.

Hmmm, that actually makes sense, now that I think about it, as I don't
recall seeing anyone ELSE's machine being used to test this virus. Not
too many volunteers, ya know? Maybe it was just a gag all along or perhaps
they didn't know about the faulty controller. Whatever, it's good to know
that physically write protecting a disk still works on Atari hardware.

But then again, it's kinda like sex... the best protection is NOT to
insert it at all. :)

Cheers,

No there is no address in Germany. You can register from Goodman
International in UK (0782) 335650

or you can send directly to JV Enterprises, PO Box 97455, Las Vegas NV 89193.
They will take Money orders, US Dollars, and now they are set up to take
foriegn currency as well.

I think you are getting confused by their product line.

They sold a patch editor/librarian for the K5, but it did not do any FFTs.

They also sold an Akai sample editor that had a feature where it would send the lowest 127 harmonics to the K5. At the time, Dr.T's was advertising that you could take any sound available, convert the sound into it's harmonics, transmit the harmonics to the K5, then have be able to play the sound on the K5. Well, it's not that simple, and if you're expecting to take that really kiiler sample and play it on the K5, well.... you're going to be a bit dissapointed.

I don't remember what the program was called, or how much it cost, but I believe that it is discontinued. Even if you were to call Dr. T's, they wouldn't be able to help you out.

A while back, a guy by the name of James Chandler Jr. wrote an article for Electronic Musician (~1988 or 1989). In the article, there is a program in BASIC for the Macintosh that accepts samples via MIDI from an Ensonic Mirage sampler, converts the sample, then sends the harmonics to the K5. I took that program, re-wrote it in C, then made so you could load in 8-Bit ST Replay samples. I never did finish it... but for the most part it worked.

From: quaver@u.washington.edu
Message-ID: <32r2kc$s2c@news.u.washington.edu>
Source record: 182085

I have a friend in RIO who has the following setup:

STE 4MB Notator SL 3.x? Unitor II SMPTE with 6 ports.

He is interested in moving up ... that is, to the latest
version of SL (?) or getting into a FALCON with LOGIC.
Since I am now a MAC user, i don't know of the latest
atari products .. so I can't help him.

1. Where can he get brochures and prices etc on the
FALCON version of LOGIC (and on FALCON itself)
(no one in his area has been able to help him)
2. He read in Keyboard that LOGIC 3.0 (?) for the Falcon
is compatible with UNITOR II. If he changes to FALCON and
LOGIC, does he retain UNITOR II and SMPTE plus the 6
ports? If not, what are the upgrade options? He
heard EMAGIC will accept old equipment in exchange
for new.. what is that policy?
3. He heard the latest version of SL reguires a new key?
4. WHat is best to do?: keep his system as is?
Get a Faclon and LOGIC? Get the latest version of SL?
5. How does FALCON/LOGIC compare to MAC/LOGIC?
6. How soon for the PowerMac/LOGIC native version?
7. Is there a SIGNIFICANT advantage to moving to Faclon and LOGIC?

THanks ...

quaver@stein.u.washington.edu

Not sure about MultiTOS. But with Geneva/NeoDesk 4 setting the ACC
extension in the GEM.INF and in the NeoDesk Preferences... as an
executable program will get you the result you want. Compatability is
identical to that of running the accessories at bootup (so far, at least).

2350. CONVERTING ANIMATIONS?

Newsgroup: comp.sys.atari.st
Date: 1994-08-16 19:36:09 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <32r4f9$9s1@charm.magnus.acs.ohio-state.edu>
Source record: 182088
Cross-posted to: comp.sys.atari.st,comp.graphics.animation

OK, here's the deal; there are, at this point, only two animation formats viewers work properly with my video card, one for .FLI/.FLC, and the other for .FLM. Now, what I want to do is somehow get from .FLI to . FLM (this is a Lexicorp Atari ST format) *and* from .FLM to .FLI, but I *especially* want to get from .TAT to .FLM *or* .FLI *or* .SEQ! Now, I can already go from .FLI to .TAT, but the .TAT viewer does not work on my graphics card. I can also go from .FLI to a series of .PI1 files, *and* I can go from .SEQ to .FLM. So, I only need one more step to get to where I want to go;

Series of PI1 > .FLI/FLC or .FLM or .SEQ
.TAT > .FLI/FLC or .SEQ or .FLM

Finally, I would really love to grab each from out of a .FLM, .SEQ, or .TAT file so I can bring them across and stitch them into quicktime movies at work or for my wife's PB165c. I especially want to snage the images out of that cool . SEQ/.FLM that has the rotating yellow Fuji symbol above the scrolling plane of "rippling water" and computer disks, that's a heck of a cool animation (esp. at 60fps, it flies and is smoothe as silk!)

Also, if anyone knows Lexicorp's email address, please let me know...

Finally, thanks for all the help that has already poured in concering my question about the .FLI/FLC format, they have been most helpful.

Toodles!

Excuse me for saying this, but i think i recall you saying, that those
people who use you'r program but isn't paying are all pirates.
Maybe i got that wrong, but when i say you didn't release a shareware
program but a demo version of an program, it's impossible to become a pirate
on that program. However if someone uses a none registred key, which give
him/her limits beyond the released program, then he/she is a true pirate.

>I've done a bit of offline reading, but most of the time I just can't be

Maybe just a matter of taste 8-)

>Ah, yes. I didn't know MetaDOS took up so many cookies. (Normally, AFAIK,
>TOS has 6 cookie slots available)

neither did i. But i'm beginning to think Cokkijarr is the problem it selves cause it also removed my problems with Semper (you know, the mailer), after i removed cokkijarr.

>
>Perhaps you should try out ExtenDOS ... it's a new CD-ROM driver from an
>author right here in Ontario ... it's supposed to be infinitely better than
>Atari's MetaDOS.
>

And so we're back on the right topic again 8-)
ExtenDOS is a commercial driver, which means i'm unable to test it before buy. And after written several messages about this, i think you know my feeling about that. What if i registre ExtenDOS and find it not working ? Give me a "legal" copy of the program and i'll make a test. If i find it working allright, i'll pay for it. If not, i'll dump it plus i'll try inform the author about my problems.

>GCC compiled files are twice as big as Lattice C compiled files on the ST
>in my experience. - Matthew

There is a program called xstrip which strips the symbol tables. Produces
about a 10% reduction in file size. xstrip source should be around
somewhere, and there is a copy of strip supplied with LC which might work.

:-)

Try Marcel WP 2.3. It's Shareware, full featured, and can import and export
most industry standard WP formats. It's well worth the $10 registration!
It can be found on most better FTP sites and it works well on 1meg machines.

Quite :-)

> I personally buy a magazine based on quality, that of the reviews,
> advice column, coverdisk and features. If the three U.K. mags are worth
> buying in one month, then i'll buy all three.

Exactly, and I must admit I'm the same. I don't buy STR & STU
religiously, but I do most of the time. I certainly don't subscribe to
the black-and-white "always buy it or never buy it" philosophy.

> They all seem to cover something different each month, and regularly
> look through my large selection of back issues for that little piece of
> Calamus SL advice that wasn't of any use back then, but now....

Hehehe... How many times have I done that - I picked up an old copy
of teh game "Millenium 2.2" this week and went back to a copy of STU
from three years ago for a strategy guide.

> staff. I've been buying STF, STR and STU for the last 2 years or more,

C.J.Ridd@cs.bham.ac.uk (Chris Ridd) wrote:

> Will the driver work only with Speedo 5, or will it work with NVDI 3
> as well? :-)

Probably won't, since NVDI 3 has its own driver concept that is mostly
based on offscreen bitmaps, though drivers can choose to handle any
or all VDI calls themselves. They just don't have to. The issues of
interfacing with GDOS drivers and color support are still unclear.

The advantage of this concept is that anyone can easily write a
driver for bitmap-oriented devices without having to rely on
copyrighted libraries that are possibly outdated the next
time VDI changes, as it happened with all pre-Speedo drivers.

Hi,
I don't have my copy of ST Internals to hand, but from memory the drive select lines are the 2 end pins on one side of the sound chip. Check in the book to make sure you have the right side before you head for the board with cutters, wire and a soldering iron, but I did this to an old ST with a 360K internal drive so I could boot off double sided disks. Just swap the pins over and voila (tm alt.hackers :-). Of course, don't do this if you believe in warrantees !!

] it has now copied itself to hundreds of millions of machines.

I hope no-one minds me posting this, but on this subject:

(123 lines)

(Alternative script from ST:TNG Episiode "I, Borg")

Author: jrd@roddenberry.ebt.com (john r. durand)

"Star Trek Lost Episodes" transcript.

<Picard> "Mr. LaForge, have you had any success with your attempts at
finding a weakness in the Borg? And Mr. Data, have you been able to access
their command pathways?"

<Geordi> "Yes, Captain. In fact, we found the answer by searching through
our archives on late Twentieth-century computing technology."

<Geordi presses a key, and a logo appears on the computer screen.>

<Riker looks puzzled.> "What the hell is `Microsoft'?"

<Data turns to answer.> "Allow me to explain. We will send this program,
for some reason called `Windows', through the Borg command pathways. Once
inside their root command unit, it will begin consuming system resources at
an unstoppable rate."

<Picard> "But the Borg have the ability to adapt. Won't they alter their
processing systems to increase their storage capacity?"

<Data> "Yes, Captain. But when `Windows' detects this, it creates a new
version of itself known as an `upgrade'. The use of resources increases
exponentially with each iteration. The Borg will not be able to adapt
quickly enough. Eventually all of their processing ability will be taken
over and none will be available for their normal operational functions."

<Picard> "Excellent work. This is even better than that `unsolvable
geometric shape' idea."

. . . 15 Minutes Later . . .

<Data> "Captain, we have successfully installed the `Windows' in the Borg's
command unit. As expected, it immediately consumed 850f all available
resources. However, we have not received any confirmation of the expected

`upgrade'."

<Geordi> "Our scanners have picked up an increase in Borg storage and CPU capacity, but we still have no indication of an `upgrade' to compensate for their increase."

<Picard> "Data, scan the history banks again and determine if there is something we have missed."

<Data> "Sir, I believe there is a reason for the failure in the `upgrade'. Appearently the Borg have circumvented that part of the plan by not sending in their registration cards."

<Riker> "Captain, we have no choice. Requesting permission to begin emergency escape sequence 3F ...."

<Geordi, excited> "Wait, Captain! Their CPU capacity has suddenly dropped to 0!"

<Picard> "Data, what does your scanners show?"

<Data, studying displays> "Appearently the Borg have found the internal `Windows' module named `Solitaire', and it has used up all available CPU capacity."

<Picard> "Let's wait and see how long this `Solitaire' can reduce their functionality."

. . . Two Hours Pass . . .

<Riker> "Geordi, what is the status of the Borg?"

<Geordi> "As expected, the Borg are attempting to re-engineer to compensate for increased CPU and storage demands, but each time they successfully increase resources I have setup our closest deep space monitor beacon to transmit more `Windows' modules from something called the `Microsoft Fun-pack'.

<Picard> "How much time will that buy us?"

<Data> "Current Borg solution rates allow me to predicate an interest time span of 6 more hours."

<Geordi> "Captain, another vessel has entered our sector."

<Picard> "Identify."

<Data> "It appears to have markings very similar to the 'Microsoft' logo..."

<Over the speakers> "THIS IS ADMIRAL BILL GATES OF THE MICROSOFT FLAGSHIP _MONOPOLY_. WE HAVE POSITIVE CONFIRMATION OF UNREGISTERED SOFTWARE IN THIS SECTOR. SURREDER ALL ASSETS AND WE CAN AVOID ANY TROUBLE. YOU HAVE 10 SECONDS TO COMPLY."

<Data> "The alien ship has just opened its forward hatches and released thousands of humanoid-shaped objects."

<Picard> "Magnify forward viewer on the alien craft!"

<Riker> "My God, captain! Those are human beings floating straight toward the Borg ship - with no life support suits! How can they survive the tortures of deep space?!"

<Data> "I don't believe that those are humans, sir. If you will look closer I believe you will see that they are carrying something recognized by twenty-first century man as doeskin leather briefcases, and wearing Armani suits."

<Riker and Picard, together - horrified> "Lawyers!!"

<Geordi> "It can't be. All the Lawyers were rounded up and sent hurtling into the sun in 2017 during the Great Awakening."

<Data> "True, but appearently some must have survived."

<Riker> "They have surrounded the Borg ship and are covering it with all types of papers."

<Data> "I believe that is known in ancient venacular as `red tape'. It often proves fatal."

<Riker> "They're tearing the Borg to pieces!"

<Picard> "Turn the monitors off, Data, I cant bear to watch. Even the Borg doesnt deserve such a gruesome death!"

-< End

Well, _I_ thought it was funny! :)

From: wells_s@ix.wcc.govt.nz
Message-ID: <32s6va$sdg@golem.wcc.govt.nz>
Source record: 182004

This was stuck up on atari-archive a few days back (archive was about 500K
with a filename that I can't recall :)

This is a reasonable Boulder-Dash clone, with not-too-bad sound, and some
very strange differences. (rocks that chase you etc.)

The shareware fee of 40DM is a bit high considering that within 5mins
of playing I'd already come across several bugs (not tiny ones either), and
the graphics are probably not as nice (in-game) as the original 8-bit
version of Boulder-Dash. (What's with DM shareware charges being so high?)
Especially as the real Boulder-dash could be obtained for about the same,
if not less :)

However, if you like boulder-dash, it's not a bad game to look at, runs
in ST-Low on pretty much every machine ST(s)/Mega ST(e), TT and Falcon...

There are several Progs which do things that you want. I only know the name of my program.
TCache has the ability to redirect drives. You are allowed to redirect each drive to
a different drive. It works on bios-level and normally it works fine, but when your
problem has something to do with copyprotection then it might be possible that this trick
doesn't work. TCache is a Cache-prog with several utilities inside an can be found
on ftp.uni-clausthal.de /pub/atari/disktools/cache under the name TC63_TST.TOS. It's selfextracting.

Agreed - one piece of comms software got me to register by being fully working but with delays when calling different facilities and by having randomly appearing reminders appear. None of this appeared whilst on line but slowed down all of the off line stuff.

> I'm also against supplying a totally crippled version. IMHO it hurts the
> programmer, as few people will be willing to register a program they can't
> test.

Agreed again - there's always the nagging doubt that a section I can't test may not work to my satisfaction, like quality of printout. A demo version which prints a percentage of the output at least gives a taste of the full version.

Wheww!! You still have one??

Well for what it's worth, any Atari ST software that runs fine on TOS
1.0 and in 256k of RAM should be okay (this doesn't leave a lot of room
for much though!). I suggest you have a look at atari.archive.umich.edu
firstly and also try to get hold of the list of FTP sites for Atari
stuff and browse around a little.

Hi,
I have put the preview of the first NPG-game on following ftp-servers
(in \incoming):
ftp.e-technik.tu-muenchen.de (oder: ftp.informatik.tu-muenchen.de)
FTP.UNI-KL.DE
ftp.uni-erlangen.de
ftp.cnam.fr

This game should work on all Falcons (TV/VGA/RGB). (The preview is Public Domain)
If you have problems please email me.

bye
Roland

Robin
Which ICD host adapter do you have? Early ICD host adapters
do not work correctly with the STe and TT DMA ports. Contact ICD
or one of it's distributors to make sure you do not have an old
style host adapter.

I'm moving from ST to Mac, but don't want to switch sequencers. Is
there a version of Creator or Notator available for the Mac? A friend
of mine who uses Notator (for the ST) in professional studio
applications mentioned there was, althought not quite the same. I have
an ancient version of Creator, and I like it so much I haven't been
willing to switch yet.

Thanks for any help on this.

H> operation.

Forgive me, but I find this very difficult to believe, unless there was a fault with the floppy drive itself, that prevented it from recognising a write protected disk. If it were true, we should all have suffered from this particular virus by now, because it would be extremly lethal! Do you have any substantial proof of this occurence? I'd love to examine the source code of this virus. My interest is purely academical of course! :-)

Maybe we should get a proffessional opinion on this before we get too carried away... Anyone know Richard Karsmaker's email adress?

SC> the best one..." - get a grip!!

Excuse me but just where exactly did I say such a thing? I made a little joke about STF, that's it! (Noticed the smiley?) Learn to read before you start flaming! And if you seriously think that all three UK magazines will survive, you are the one who should "get a grip". I already got my copy thankyou, (the Aerosmith one that is) and to tell the truth, I can barely afford to buy ONE magazine each and every month, because by the time they get here they've gained something like 200% in price, but when I do, I usually pick up a copy of ST Review (on it's own merit, not because it's cheap (it isn't)), but because it's the best in my book and if you've got another opinion, than fine with me. Take your own pick.

SC> I personally buy a magazine based on quality, that of the reviews,
SC> advice column, coverdisk and features. If the three U.K. mags are
SC> worth buying in one month, then i'll buy all three.

I wish I were so lucky.

SC> If you think that any of the magazines are crap, then they're wasted

>A boot sector Virus is as it states, it installs its self ONLY on boot up,
>so checking disks for valid boot sectors is all that is needed, but you must
>boot your Atari with out a disk first, or with a know Virus free disk..

Er, there has been one or two viruses that could get round that. Anyway, how
would you know if a disk is virus-free or not if you DON'T have a virus
killer?!?!

>Viruses can't write to a write protected disk, its that simple...!!!

>With a sector editor, read the boot sector, Track 0 sector 1, check if the
>first byte is a 61 and change this to a 00, if this stuffs up the program on
>the disk, then change the 00 back to 61.....

Ha ha! This is a bit risky to say the least! (Clue- don't try this with games
or demos!) Anyway, I thought the hex value for a short branch was $60 not $61...

>Virus check programs wipe the hole boot sector, so be warned, you can't recover
>them...

Well.... They CAN if you want them to, but they generally just READ the
bootsector and check it. Secondly, you CAN recover some bootsectors- with the
help of some virus killers! Guess whos not been using any.... :)

>NOTE: most and if not all Boot Sector Virus protection programs are VIRUSES
> in them selves, as they will copy them selves to other disks....

!!!!!!! Fume! Fume! Fume! !!!!!!!!!!!!

Now, as the writer of a bootsector virus protection program myself, I must
say that this is a load of complete crap, and written by someone who obviously
doesn't know a damn thing about bootsector virus protection programs. Viruses
spread. Viruses copy themselves to other drives. Most virus protection programs
do NOT do this. One or two do this (eg "english/dutch" antivirus) do but MOST,
in fact the VAST MAJORITY, stay resident in memory and either check for an
executable bootsector, or check for reset-resident programs, or in the case

of my Agraboot v2, both! (And it checks for suspicious code as well!)

Oh well, I suppose you know more about what my code does than I do! :):)

>When playing (Booting) with unknown floppy disks, Turn of your Hard drive, or
>dissable the booting of the hard disk, a Ship program can turn off internal
>hard drives...

What? I thought you said there was no hard drive viruses!!! Erm, if you're booting from a floppy, then surely the hard drive doesn't boot up anyway? And if you're booting up from an HD, then bootsector viruses won't be installed anyway since you're not booting from the floppy! Tell me, what sort of strange system do you have in which you simultaneously boot up from the floppy AND HD!

>I have never had major problems with Viruses, and I see no point in spending
>money on Virus check programs....

To be honest, viruses are usually more of a pain than a major headache, but I don't want to be the one with a major headache! I don't really see any big conspiracy between writers of virus killers. Some of the viruses (Most of which are thankfully quite rare) ARE pretty dangerous and are not made up by writers of virus killers.

>NOTE: The bigest Virus for STE's users is the old DMA chip, it has stuffed up
> 2 Hard Drives for me....

That was not a virus- it was a bug.

>NOTE: A valid floppy boot sector is when all the bytes add up to 1234 as a sum
> check, pad bytes are added at the end of the boot sector to get a valid
> boot sector, so changing any byte would make the boot sector invalid...

No, actually, a checksum is stored in bytes 510-511 of the bootsector in order that the values of all the word lengths (NOTE- a word is 2 bytes!) adds up to $1234. (ie 1234 in hexidecimal!) This is needed for a bootsector to be EXECUTABLE not "valid"! (A disk formatted on the desktop has a "valid" bootsector, but it is not executable, and doesn't have a checksum of $1234.) However, a virus has been done (See UVK documentation) that actually work from a non-executable. Again, it's not very well spread, but it does make one think.....

>Just some food for thought....!!!

No offence Roger, but you should have thought a bit more before you embarked on the above tirade.

Michael.

Have you tried running with the shell program? It is necessary for 1 Meg machines. I makes things inconvenient, but it does work.

I, however, have run into numerous other problems with both the online editor and parts of the reader itself.

Unfortunatly it do works sometimes, but most often the author is online and
prepared with new versions. And then you can growe old in new versions due
to new bug in all the updates, which also is happening very often.

From: nicole@seas.smu.edu
Message-ID: <1994Aug17.164907.21298@seas.smu.edu>
Source record: 182032

While we're on this subject, what are the advantages of Wordwriter 2, which the previous poster used to have over Wordwriter 1.0, which I still have and use all the time?

2397. Spectre GCR documentation

Newsgroup: comp.sys.atari.st
Date: 1994-08-17 16:56:36 UTC
From: nicole@seas.smu.edu
Message-ID: <1994Aug17.165636.22732@seas.smu.edu>
Source record: 182035

My used GCR arrived without docs because, it turns out, the seller didn't have them. I've written, emailed, and called Small to no response. I asked someone to photocopy, and they said it would infringe the copyright; who can argue when they're begging, because it would infringe if they sold it for profit.

Any suggestions on how to get a copy of the docs? Anyone have the docs that formerly belonged with my GCR now ready to sell? Anyone seen them at a used book store?
Thanks
John Trimble

Yep, my copy of Graham Gooch's World Class Cricket came with a nice copy of the Ghost virus. And there's no way I could've inadvertantly put it on myself as I write-protected the disk before I put it in the drive.

Luckily my autovirus detect thing spotted it and I mashed it into the dirt (the virus, that is, not the detect thing).

>Give me a "legal" copy of the program and i'll make a test. If i find it working
>allright, i'll pay for it. If not, i'll dump it plus i'll try inform the
>author about my problems.

Actually, that's what magazine reviews and Usenet News articles are for --
giving you a chance to know about a product without having to buy it for
testing.

For the record, ExtenDOS works quite nicely with my ICD ADSCSI+ host adapter,
and with the new Link2 host adapter, and it works right out of the box. The
instructions are straightforward (much more so than ever was the case with
MetaDOS), and all I had to do was, literally, plug and play.

The ONLY problem I've had with the Link2/ICD/ExtenDOS stuff is hardware based,
as the termination on my 300 meg hard drive is such that I cannot autoboot
from the hard disk with the NEC CDROM attached to the SCSI through.

Basically, if I were the author of a software product and received complaints
from someone who hadn't bothered to pay for the product in the first place,
I might tend to dump the letter in the same place you say you'll dump the
software.

Source record: 181985

>Does anyone know of a V.M driver compatable with the Mega STe? PD or
>shareware preferable, commercial o.k. too. <as long as it's not too much <G>>

The MSTE (and all other STs) cannot do VM as the 68000 chip is just not up to the task. Nothing much can be done about this except changing the CPU. A 68030 (or a 68010 upwards with a suitable MMU chip) will do.

The best solution currently is the PAK3 board. This is a 68030 running at between 33 and 50Mhz. It has an optional FPU unit, and patched TT (TOS 3.06) ROMs. Cost is around 360ukp, but a tower case may well be needed to fit it all in (another 200ukp odd). Performance wise, the PAK3 @33 is slightly faster than the standard TT.

I haven't got one fitted myself yet (I have a similar MSTE), but Outside (the most popular VM manager for the TT and Falcon) is reported to work with the PAK3. Outside is the best part of 100ukp AFAIK.

This combination should run the 68030 version of MiNT, and also in future Linux, once all the suitable drivers are written.

Anyway this is the route I'm aiming to go.

:-)

>I used to buy STF regularly, then they brought in the 'Cover Disk' thing, and
>forced me to pay loads more for a disk that I didn't want, or need. Invariabl

But STF always *had* a cover disk! Its its 'trade mark' - back from the
days when it was ST Amiga Format (or are we talking about different STFs?).

Granted - STF has always been a bit too glossy, and a bit too inaccurate
for its own good, but its better than it has been in the past (although
not as good as it originally was). STU and STA OTOH have both taken a bit
of a slide in recent months, whereas STR is still very good.

Roland.

2407. Re: How to reduce size of GCC-compiled programs?

Newsgroup: comp.sys.atari.st
Date: 1994-08-17 23:18:29 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CupCqu.JtE@cix.compulink.co.uk>
Source record: 181987

>It does but they are still twice the size, I am comparing totally stripped
>and optimised short int files. They run at about the same speed though.

I must admit I've noticed this too. I've also noticed that GCC compiled programs have a very large overhead. Just try compiling:

main(){}

on both. The GCC is noticably larger ISTR.

OTOH as programs get larger, the difference in size gets smaller. Also the MiNT libs avaliable for GCC make porting Unix code so much easier. (I know MiNT libs are available for LC now as well, but they have not always been as up to date nor easily available).

Eg when I ported CBZONE, the first version was done with GCC as LC wouldn't touch it. It was only when the GCC port worked, that I started work on the LC version. It only took 2 days for the initial GCC port, but the conversion to LC took 2 weeks, due to the lesser LC libraries. However in the end, I released a version compiled with LC as it was smaller, had support for FPUs and didn't run any slower. The only thing it didn't do, which the GCC compiled version did, was run under MTOS. Don't know why.

:-)

Roland.

>.TAT > .FLI/FLC or .SEQ or .FLM

.TAT is a format that isn't supported on the Atari Platform, Lexicor Software
has a utility that will make an FLI into an FLM, but not vice versae.

Using Prism Paint you can save off single images as PI1 or GIF from your
FLM, Lexicor Software also has a GIF-FLM, GIF-FLC and TGA-FLX Builder for
15/16bit animations.

Lexicor Software's email address is info@lexicor.com or services@lexicor.com,
on the other hand you can just email to me (reply) if you like and I
will be happy to help you out in any possible way.

Yat @ Lexicor Software

From: Ari Feldman <ari2550@delphi.com>
Message-ID: <Be8yFad.ari2550@delphi.com>
Source record: 182047

Just a question...

Last year I did the graphics for a simple platform game called Thurg & Murg.
It was included as a demo game for a game development system released here
in the US.

Recently I have heard rumors that the game was released on a cover disk of
either ST-Review or ST-Format. If that was the case, I never received
one cent for this.

I'd appreciate if anyone in the UK could verify whether or not the above
game appreared on one of those cover disks. To narrow things down a bit -
I was told that it appeared sometime in the late fall, early winter (ie
Novemberish).

Not that I'm gonna try to claim any $ from it - I just want to get a better
picture of how some people I had been involved with have been ripping me off.

Thanks in advance...

Ari

CH> Total stagnation. *snore*
CH>
Here, here!!!!

The computer industry has lost most of the wonder and excitment that it used to have!!!

I remember getting excited when I knew that the latest issue of Dragon User was in the shops so that I could read about the latest developments, even though I couldn't afford them.

Now all I get is bored! Trying to fight my way through 30+ PC mags and 8 Mac mags to get to 3 ST mags isn't any fun!

Spencer

R & D for Atari personal computers may have been suspended, ok shut down,
but can't the knowledge gained from developing the Jag II be transfered
into a computer. The Jaguar is, after all, a computer without a keyboard.
If the 68000 was replaced by a 68040 or 68060 (when available) I'd buy it.

Wait a minute.

I'll need a floppy drive.
And a SCSI/IDE port.
And a SVGA graphics board.
And a printer port.
And more memory...

Nevermind ;)

What's not to understand here??? In theory, the ST and PC 720kb DS disk format is identical - older versions of TOS <1.4wrote incompatible boot sectors, other than that - most ST DS disk should read fine on the PC.

If it doesn't then you should use a program like the NORTON DISK DOCTOR or clones to correct the ST's disk structure to standard DOS format. If you're careful you'll hae a PC readable ST disk!

If you're fortunate to have an ST disk formatted on a newer TOS, the ST disk can be read and written to like any other PC floppy, etc.

>Yeah, the EM article seemed to have a reasonable tone,
>except that it gave the impression that Atari once
>supported its customers and doesn't anymore.

I also agree that the article was a fair discription of the computers and their problem and strengths. They also stated that they did not think it was too late for Atari to turn it around..
But James Grunke has a valid point , I did not appreciate Atari being lumped in with
Amiga, Not because it was amiga but because of the recent demise of the platform.
Atari is STILL in business and should not be associated with a company that is liquidating.IMHO

Hi

I do UK support for MasterBrowse, and am aware of this problem. I
reported the problem to both Michel Forget (the author), and Robert
from Compo, about 1 - 2 weeks ago.

Robert told me that there are probl;ems with Speedo 5a, and that you
should get Speedo 5b..and try it with that....

He is also looking into the problem....

Michel Forget is going for the next version, and is implementing a
different font selector. This should cure the problem...

MasterBrowse works with all older GDOSs, and Speedos and FSMGDOS,
though....

I think that what you are thinking of, is called Unix Windows....

The windows only display text, though...but is OK to use....

This is available on many sites, including micros.hensa.ac.uk

Mail me for more details...

Also, *I Think* that something called Screen does the same thing...you
need MiNT to run this...not available at hensa yet, but is on other ftp
sites...and your friendly neighboourhood a.a.u.e

Hope this helps.

Dan.

Hi all

Anyone seen this book yet? I saw it in a shop the other day, and
scanned through it.

I was surprised.....the section on Atari PD software, only had
wustl.wuarchive listed!!!! No mention of atari.archive at all.

hensa was mentioned, but under the DOS section....hmmm.

Anyone know how to go about informing these people about the inclusion
of a.a.u.e (I admit, I respect this site), and hensa (which I am trying
to make respectable for Atari software)?

Danny.

>HI, do you know who is developing Mosiac for the ST? I would like to send a
>kind word of encouragement (though I've got no clue at all how to get a SLIP
>connection for my ST, I understand it can be done).

Having a HTML browser on the TOS series is desirable even if you don't
have a SLIP connection or whatever, for example (from my experience) if
you are writing your WWW pages at home on your TT, because there you've
got a nicer text editor than at work on the UNIX boxes. It'd be good to
have a browser to get an idea of what it is you are creating.

BTW, a WWW browser doesn't necessarily have to be Mosaic. AFAIK,
Mosaic is heavily based upon Motif, and hence a little hard to port
to the Atari. Perhaps ZFC will have a go at a HTML browser/editor
in the (not too near) future.

Accessing the web on a phone line, at whatever speed modem, doesn't seem
wise to me. It is going to be very expensive and time-consuming.

Is that so? Interesting. Then it can't be more than a poor kind of
MT-32 emulation. Some of the MT-32 sounds are fairly sophisticated
and could, IMHE, not be emulated by combining samples...

So that basically means the Sound Canvas is hardly programmable at
all? (I.e., no analog partials to make your sounds interesting?)
Or can it TVF the sample partials?

The problem is that even the CIA/FBI haven't a clue how to decode
PGP encryption and the government HATES secrets to be kept from
them. <grin> There are long-standing US laws (for national security
reasons/etc.) that put data encryption on a fine line between legal
and illegal. Basically, as long as the US govt. knows how to defeat
the encryption, it's legal, but if they CAN'T defeat the encryption,
they see it as a possible risk to national security. Since the
government can't figure PGP out itself, they are taking the author
of it to court to get him to release the encryption algorithm to
them -- at least that's what I've heard. For now, the US govt.
just wants to make sure it's not being used to transfer data in and
out of the US. If they HAVE taken the PGP author to court, it will
be interesting to see whether the courts decide in favor of right
to KNOW or right to PRIVACY.

Atari's computer R&D has been cut WAY down, but not killed off
completely. They've discontinued all their computers except
for the Falcon030. While their priority right now is the
Jaguar, Atari has licensed the Falcon hardware to C-Lab to
produce a music workstation.

Source record: 181994

There is my manual paging suite for MiNT (I assume you want it for
MiNT if you want csh.1 formatted) using groff in

phl[ie]m.ph.kcl.ac.uk:/pub/MiNT/mans/*

It's set up for the MDK, but since `man' is script-based I'm
sure you can alter it if you don't have directory structure like:

/usr/local/lib/groff
/usr/bin
/bin

.. on your HD.

extract from the README:

The manual paging script is my own, as is the mkwhatis stuff, any
bugs or enhancements to me please (sjg@phlem.ph.kcl.ac.uk)

The man script handles :

o -k (for apropos)
o compressed formatted and unformatted pages.
o The MANPATH variable

You need a minixFS to run it as it stands, but it would be
trivial to alter it to use TOS style extensions.

ATB,
Simon.

But only if you have TOS1.4 or higher. The earlier machines used a different
value in the boot sector, which meant DOS failed to recognise them.

I wrote a little PC program to enable disks written with TOS < 1.4
to be read by a PC - it only changes ONE byte on the disk and it
allows you to change it back again if you wish (but not necessary).
The TOS disks HAVE to standard format (80 track/9 sectors).

IF YOU ARE QUICK:

It is (temporarily) at: ftp.mechnet.liv.ac.uk

The directory is: j_boyes

The program is called: TOS.COM

I shall remove this file after a few days. If anyone thinks it
is worth putting onto a proper ftp site, let me know.

John.

> the pitfalls? (If it is solder-free I can cope, otherwise no way!)
> Mike

Installing the HD will be solder-free. Getting inside the case is the most difficult part.

If you've taken the Stacy apart before, no problem... just take the case apart, look for the hard drive underneath the floppy drive on the right hand side, remove the screws for the metal mounting from the motherboard, remove the screws holding the hard drive to the mount, remove the power and SCSI cable from the drive and reverse the procedure after hooking things up to your new drive. Just make sure that parity is disabled on the drive before installing so you don't have to go through the whole procedure again to disable parity later.

If you've never opened a Stacy case before, I can provide fairly detailed instructions for doing so. It's not as easy at first as it may seem, though once you get it down you can have it apart in 10 minutes. Just let me know if you need instructions, and I'll send them your way.

|> Just write a new value to the same positions (but if you select
|> a larger buffer-size, you must also set a new buffer-adress that
|> points to a allocated buffer, and set the water-mark right).

A few points to note...

(a) There is no need to mess with the hi/lo water-marks - MIDI doesn't support handshaking to control the flow of bytes so they aren't used.

(b) The COMPUTE! TOS book has the description of Iorec buffers wrong - new data is written to the _tail_ of the buffer (which points the the _last_ write position and is pre-incremented) and read from the _head_ of the buffer (which points to the _last_ read position).

(c) The MIDI buffer is a circular queue, one element of which cannot therefore be used (head = tail is used to indicate "empty").

(d) Before changing buffer address/size, set head = tail = 0; Also if new buffer is bigger than old, change the address first, otherwise change the size first. These precautions avoid a nasty race condition that could cause data to be written beyond the end of the smaller buffer.

(e) Before your program exits, replace the original TOS buffer, again observing (d) (TOS buffer is now the "new" buffer!).

(f) If you plan to read MIDI data at anything like MIDI bandwidth don't read the buffer via TOS; do it directly, looking at the tail index to avoid reading stuff that hasn't yet been write (ie garbage).

Steven

2465. Re: Med Rez desktop.inf

If you are having trouble with your desktop.inf file, it may be that you've filled it up with various settings so that TOS can no longer understand what it's supposed to. When you UNinstall an application or a desktop icon, it actually adds a character or two to the file, which becomes full to bursting.

What has worked for me is to load the DESKTOP/NEWDEST.INF into a GOOD text editor (STeno works perfectly) and edit out the entire line of uselss information, line by line. This has restored my boots on multiple occasions.

I recently tried to add SpeedoGDOS (4.1) to my Geneva (release 003)
set-up, and have hit a glitch. First time I booted, everything went well;
I then selected some nice Speedo font for Geneva, rebooted, and ..
Splut. Crashes while showing _the_top_half_ of the Geneva welcome
screen.
Same result if I run Geneva, and then run Speedo.
Anybody seen the same problem?

Mail just gets returned...

Hi Simon

Just a question about the MDK....I have used it before..and it's
brilliant! I'm sure you know, it's on hensa....

Anyway, I am reinstalling the MDK, and am trying to set up a minix
partition using your install program...but the partition is still
readable by TOS.....

Am I missing something here?

Regards
Danny

PS...any chance of putting the digests (gem-list, MiNT) on hensa?

There is actually any one of about 2 dozen formatters which do this. DCformat isn't bad. Pretty much any formatter will let you do an MSDOS bootsector with extra tracks/sectors/skewed tracks etc.

ac> Do you know the algorithm for calculating the bootsector checksum?
ac> I know about the XBIOS function that sets the pad bytes correctly
ac> in a bootsector in memory, but I have never seen any docs describing
ac> the checksum formula used by TOS.

An executable boot-sector is recognized by the sum of all 16-bit words in
the boot-sector being $1234. Note that this is *Intel* words, so you have
to swap hi and lo byte in every word.
Now, to make a boot-sector executable, you sum all *but* the last word, and
subtract this sum from $1234. The result then goes into the last word of the
bootsector. And again - remember to byte-swap...

The same check-sum system is used on sector 0 on hard-disks, and the
boot-sectors on each partition. The executable boot-sector on sector 0
contains a routine to read the partition map, and then scan the
boot-sectors on each partition until it finds an executable boot-sector (if
it exists).

Cheers,
Erling

2476. PLEASE use 'Include' in your replies!

Newsgroup: comp.sys.atari.st
Date: 1994-08-18 16:14:30 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9408181527.AA01056@ilmen.lanl.gov>
Source record: 181918

Please, please, PLEASE...

When you reply to someone else's post here in the newsgroup, kindly include a short reference to the original post in your reply so the rest of us will have some notion as to what you are talking about!

It's extremely frustrating to read a post that is in response to an earlier one and not be able to figure out what it's about.

You don't have to include the ENTIRE post (please _don't_) but a short snippet referencing the original article and a few lines of that article that you are replying to will help us out a lot.

For example:

In article <33abcd$ef3@abc5.abc.com>, Joe Blow <blowj@abc.com> wrote:

> This is just an example of how to reference an earlier post. Please
> include the name and/or email address of the person who sent the
> post and a few lines of the message you are commenting on. Most news
> readers come with an 'include' feature, but even if you don't have
> that, you can still manually copy a few lines of the original text.

And if you are responding to just ONE individual (like a 'for sale' post), then why not send that person a private EMAIL instead?

And while we are at it, would it be too much to ask those of you with HUGE signatures to thin them down a bit? Net policy requests that sigs be limited to no more than 4 lines.

Lastly, if you include the original poster's name and email address at the top of his included text, then why ALSO include his signature???

No, I'm not the net police. I'm just tired of wading through so much unnecessary garbage every day... kinda like THIS post. :)

Thanks,

-Hutch- @ Fair Dinkum Tech

I have just uploaded no less than nine of my freeware games to ftp.uni-kl.de (I don't know how soon they'll be accessible). However, I'm not having much luck uploading to a.a.u.e.

a.a.u.e itself wasn't accepting anonymous access, so I tried logging on to mac.archive.umich.edu instead. This worked, but I couldn't find a /New folder in /Atari. Have they changed it, or was it just inaccessible because I'd logged in through the mac address?

Oh, by the way, the games are AXIS, CONFUSION, CYCLOTRON, CYCLOTRON II, ERGON, PIPETRIS, R-ZONE, R-ZONE 2 and TRACKBALL. They're all written in STOS and I'll probably upload some of the source code to ftp.uni-kl.de next week. Most of them are already in the UK PD libraries, but a couple were previously unreleased.

>to KNOW or right to PRIVACY.

I'm pretty sure that the government of the United States of America know
the encryption algorithm all too well -- it's the algorithm for which they
issued a patent to RSA, Inc., after all. :)

There would be a lot of businesses (primarily banks) who would be upset if
the government of the United States suddenly declared data encryption illegal.
An invocation of 'national security' would be politically inept.

UW (Unix Windows) is a terminal program that let you have many windows on
the ST side. To use this you need a UW server on the UNIX machine that
controls the output/input to/from the windows at your end.

From: william@oslonett.no
Message-ID: <WG$KkCjGVGVd057yn@oslonett.no>
Source record: 181926

I am friend sell a Roland D5 (LA) synth. It is in mint conditioni,
and hardly used. (That's why she's selling it..:-))

All but two patches are intact, and a lot PD patches can be found on
Internet. (Even patches that makes it proform like it was a GS synth)
All manuals are included in very good condition, as well as a PSU.

This synth makes a very good "first synth", I know, it was my first real
synth. (But I would not like to part with mine.. :-))

It is 8 part multitimbral, and has 32 voice polyphony. It even has a seprate
drum part. That enables you to have 8 instruments + 1 drum part going at
once. (Sequencers can be found in PD libs, and on Internet..)

She would like a about 3000Nkr/285ï¿½/428$, but any offer is of interest.
(Excluding P&P) This is in the Oslo/Norway area..

I all offers will recieve replies. (unless something technical makes it
impossible.)

Please note that I am not selling, a friend of mine is, and any
decision is up to her.. (She does not have a net account..)

Send all offers to:
william@oslonett.no

>Also, *I Think* that something called Screen does the same thing...you
>need MiNT to run this...not available at hensa yet, but is on other ftp

Screen, at least the one just started to get around is similar but not the same. What it allows you to do is have multiple *MiNT* sessions in one window (either full screen, or windowed under TOSWIN or MINIWIN). If you have a terminal attached to a serial port it will allow multiple sessions on that, *even* if the terminal cannot do multiple sessions as standard.

The port I've seen is still pretty new, but the bugs are being ironed out rapidly.

In a previous article, clark@ee.ualberta.ca (Gregory D Clark) says:
+ I need HELP! My 1040Ste ReFUSES to boot in Med Rez anymore, I
+ think it has something to do with the Desktop.inf file,
+ can anybody tell me what has to be in the desktop.inf for the
+ computer to run med rez at boot up???

Take a text editor to your desktop.inf, and find the line which says something like "#E 00 12". Change the 2 to a 3. This makes it boot in hi-res, and on a colour screen the STE will default to med-res. You will need to do this every time you "save desktop". Alternatively, get hold of the STE_FIX patch for your auto folder.

Stephen

Unix Windows is cool, though somewhat limited by the use of the adm31 terminal type. There are two versions out there, one mostly English and one mostly German. They are both a bit buggy, but usable.

This program requires that you compile a small C program on the UNIX box you want to use. Then, log in via the ST using Unix Windows (just like a regular terminal program) and run the small host program. At that point, you can open more terminal windows on your ST. Data to and from them will be multiplexed across the single serial line.

Be sure to set your terminal type to adm31 on the UNIX end. This might require a modification to your .login file (to do it automatically), as the adm31 is not a common terminal type these days (remember those, the art-deco curvy blue ones?).

> Also, *I Think* that something called Screen does the same thing...you
> need MiNT to run this...not available at hensa yet, but is on other ftp
> sites...and your friendly neighboourhood a.a.u.e

Screen is a bit different. Typically, Screen would be installed on the UNIX box by the pertinent system staff (you might already have it; type "man screen"). Screen simply allows one to switch between "virtual" terminals with a keypress. In other words, you still only have one window, but you can flip between several terminal sessions with a hot key. Thus, any ST modem program can be used.

Screen is quite handy. For one, if your modem connection dies, you need only log back in and do a "screen -r" to get right back where you were. Also, you can begin something at work in Screen, detach yourself from the tty with a special command, go home, log in, and reattach yourself to it.

Running Screen via MiNT would provide multiple virtual ttys on the ST, not on remote systems. You would have access to several ST shells, but that is not what is desired here.

2490. Software for sale or trade

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 00:52:25 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <330vo9$mna@mailer.fsu.edu>
Source record: 181853
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For sale or trade:

Well, time to clean out the software shelf! Below are a bunch of items I want to sell or trade. For buyers, highest reasonable offer gets the item, with preference going to those that buy more than one item. Shipping will be negotiated with the offer.

As for trades, let me know what you have and we may be able to work something out. I am looking for some games (Vroom, Chaos Engine, Armorgeddon, Prince of Persia, and many others), Stereotek 3D glasses, working Wico bat handle or Ergo joysticks, European ST magazines (ST Action and ST Review) and probably lots of other stuff. Cash can make up for deficient trade material from either party. Shipping will be negotiated with the trade (though for trades, I often suggest that both parties eat the shipping). Don't be shy, send me some email and let me know what you have to trade.

All of the items below are original commercial products owned by me. Unless otherwise noted, all original boxes, manuals, and disks are included. I have cheat codes for some of the games, and will include them with the sale/trade.

Please reply via email.

****Application and Utility****

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch either. Blazingly fast (hence its name), even on a box-stock 8mHz system. Designed for programming, great for general editing as well.

Neodesk Command Line Interpreter, v. 2.0, adds a command line interface to Neodesk with MSDOS/UNIX style commands. More commands can easily be added (the GNU versions of standard UNIX utilities, for example). This version is really more MSDOS-like than UNIX-like, but the new version 2.1 (to which this can be upgraded) is supposed to be more UNIX-like. There are a couple of neat things about this CLI. First, it pops up in a window on the desktop, so a CLI is only a mouse click (or keyboard macro) away. One can drop batch files onto the CLI icon to execute them, which can be quite handy. Finally, it is quite small, primarily because it reuses the routines in Neodesk to do standard file operations (i.e. when the CLI copies a file, it uses the code already in Neodesk to do it). Only works with Neodesk.

Wordup v3.x, Neocept, with the large thesaurus and large dictionary extra options, plus lots of Genie notes about bug fixes and work-arounds. This is an excellent WYSIWYG word processor, but it does have some bugs. The rights to the code were purchased by Atari (and some of the code used in Atari Works, or so I hear). It is not buggy enough

to be unusable, just irritating at times. This is the final version
that was released.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet
printers, includes a bunch of 150 and 300dpi GDOS fonts. Claims to
be 200-500% faster than other HP drivers (for that time, I don't know
if there are faster ones out now).

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft
product ever made for the Atari that I know of, includes a full
copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez,
did I really do that? I must have been really patient back then :-).
I managed to produce a bunch of papers and letters with it using only
a floppy and color monitor, so it is somewhat useful.

Personal Pascal, ICD, I believe this is the final version of this compiler.
The only limitation with it that I know about is that one cannot
pass functions as arguments. Other than that, it is a complete
Pascal compiler environment. The lack of this feature will not
hamper most Pascal programmers, IMHO. Good docs on both Pascal and
the Atari programming environment (it's a big fat softcover book).

Home Accountant, Haba systems, personal financial management software. One
can manage budgets, bank accounts, credit cards, print checks, etc.
It can also generate a tax summary and other budget things.

Time Link, Batteries Included. Excellent personal scheduling software.
Has a few bugs, but greatly useful stuff. Can search/sort database
of entries, shows one's schedule by the week, month, year, etc.
Very easy to use, well-designed GEM user interface.

Warp 9 v.3.75, Codehead, The (IMHO) second best screen accelerator for the
ST. Can be upgraded or used as-is on ST/STe/TT. I'll include lots of
extendo-save screensaver modules that I have collected. If you have
the bucks, NVDI is better IMHO, but Warp9 is vastly better than
nothing and significantly cheaper. This is the successor to QuickST.
Allows fancy desktop fills, mouse acceleration and effects, use of
different fonts on the desktop, and of course the cool extensible
screensaver.

Interlink, Intersect Software, telecomm program, supports vt100, very easy
to configure and use. Good macro capabilities. No Zmodem.
Original disk only, no docs (but the full Gem interface is quite
easy to figure out).

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES (Arcade Action)****

Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two simultaneous players. Plenty of fast and furious shooting.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II in space, best with two simultaneous players (screen is split to give each player their own view). Overhead view, destruction galore.

Xevious, Mindscape, port of the stand-up Arcade game Xevious, vertical scrolling "fly over the landscape shooting and bombing everything" game.

Ballistix, Psygnosis, Bizzare soccer style game, where one shoots at the ball to move it around. Really great graphics, so-so gameplay.

Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action). Future setting, sideways scrolling, large sprites, good guns. This is a pretty hard game, but lots of fun.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross country motorcycle racing game, Crazy Cars is a racing game. Both are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Custodian, futuristic platform shoot'em up game, excellent graphics, fast scrolling, lots of weapons, etc.

Eliminator, strange driving/shoot'em up game, lots of different weapons and bad guys.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small child (in terms of its difficulty). A bit boring for us big children, IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics are quite lame (mostly text, in fact), but I suppose a political process fan might like it. It does not appear to be particularly tied to the 1988 elections, and has data for US elections all the way back to 1960. Can apparently be used to predict elections as well.

****Adventures (Graphical Adventures, most with some arcade action)****

Temple of Apshai Trilogy (includes Temple of Apshai, Upper Reaches of Apshai, Curse of Ra), Epyx, full docs, classic blast from the past, nicely done. These are overhead view graphical role playing games (RPG).

Ultima III, Origin, with all docs, cloth map, box. Classic RPG adventure, by Lord British.

Questron II, SSI, RPG, very similar in look/feel to Ultima IV, in terms of graphics and gameplay. Medievil setting.

Bard's Tale, Electronic Arts, yet another RPG, very good. Graphically impressive for its time. Search through buildings, dungeons, and towns (Skara Brae) in 1st person 3-D graphics (small graphics window

and restricted movement, but this was many years before anything like
Doom was ever seen :-).

Mercenary: Escape from Targ and Second City, early 1st person 3D vector
graphics adventures. Future setting.

Gold of the Realm, Magnetic Images, very similar in look/feel to Ultima III,
in terms of graphics and gameplay. Medievil setting.

Breach, Omnitrend, classic RPG game, GEM interface mostly, future setting,
control a bunch of Space Marines as they search around and shoot
stuff.

2491. Re: Med Rez desktop.inf

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 00:56:18 UTC
From: daveh@netcom.com
Message-ID: <davehCurBxu.4yG@netcom.com>
Source record: 181932

I think the problem is that he has an early version of Tos 1.6 that did
not save the resolution correctly. You could work around it by editing
the desktop.inf file in an editor and changing a 2 to a 3 (3 is the normal
for high res) the machine would then boot in medium res on a colour
monitor. I can't remember which character to change right now but if you
need this information I will dig up some of my old desktop.inf files and
have a look.

Dave.

Rob S. Rice (rrice@netnews.upenn.edu) wrote:
: If you are having trouble with your desktop.inf file, it may be that
: you've filled it up with various settings so that TOS can no longer

2492. Wanted...Unitor&Combiner for Notator 3.1

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 01:23:18 UTC
From: bjr2@Ra.MsState.Edu
Message-ID: <3311i6$cnh@Tut.MsState.Edu>
Source record: 181931

Greetings,
I'm looking for a new or used Unitor & Combiner for C-Lab's Notator
Version 3.1. Does anyone know what the going rate for these pieces of
hardware is in terms of cost? Know anyone who has one for sale?

Brian

2493. Notator Question

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 02:03:34 UTC
From: bjr2@Ra.MsState.Edu
Message-ID: <3313tm$cnh@Tut.MsState.Edu>
Source record: 181933

Aloha,
I recently picked up a used copy of Notator 3.1 (by C-lab) on the cheap and have encountered a problem or two. For starters, I run this program on a 1040 STE (4meg/TOS 1.62) and use an 80meg Seagate SCSI HD with ICD's AdSCSI+ host (Ver. 3.54 software).
The first annoying problem is that when I run Notator from my hard drive it refuses to look at floppy drives A or B. Any time I try to access a floppy from Notator the system freezes; however, if I swap over to another soft-link partition, the GEM desktop and any programs that may be running in it have no problem with floppy access.
This floppy access problem occurs in Notator both with and without Soft-Link installed. When running Notator I very rarely use any memory resident Auto Folder programs or Accessories, so this doesn't seem to be the source of my problem.
Also, if I run Notator from a Floppy, it seems to look at Floppy A just fine, but if I switch over to any other Drive or HD partition, Notator once again refuses to acknowledge the existance of Floppys and freezes the system.
Am I pulling a bonehead somewhere or is this a bonafied Bug?
Next, I have problems running Communications programs such as Lars & Wolfgang Wander's "Connect" from within a Soft-Link Partition. Connect can't seem to get control of the RS232 port...the modem just flickers, almost as if the DTR isn't pulling down low enough to pick up the phone. Interlink ST works fine until Notator decides to send and all notes off message out of every port on the ST (or whatever it's sending when a playing sequence hits the STOP pattern.) and knocking the modem offline. Since I don't use Export...I"m wondering if there is a way to tell Notator to ignore the modem port all together...so it will never send midi type data or baud changes etc...???
Suggestions for these problems?
Other than these minor annoyances, Notator seems to be worth every penny I paid for it. I've yet to find a sequencer as percise and flexible avalible for the ST...even when multitasking it never blips bleeps or misses a beat as far as the music is concerned.
Notator users...let me know who you are...we can exchange tips.
Brian

2494. Falcon Logic

Source record: 181840

-> 2. He read in Keyboard that LOGIC 3.0 (?) for the Falcon
-> is compatible with UNITOR II. If he changes to FALCON and
-> LOGIC, does he retain UNITOR II and SMPTE plus the 6
-> ports? If not, what are the upgrade options? He

I am interested in this upgrade as well. My understanding is that Unitor
is still usable with Falcon /Logic, but Export is not. Unitor provides
the smpte i/f.

-> 3. He heard the latest version of SL reguires a new key?
-> 4. WHat is best to do?: keep his system as is?
-> Get a Faclon and LOGIC? Get the latest version of SL?
-> 5. How does FALCON/LOGIC compare to MAC/LOGIC?

A new key is provided with the software, in exchange for the old dongle.
He should keep in mind that Logic is a very different program from SL.
It is very much like Cubase with several unique twists, and still has
some SL features like Hyperedit. He may also consider going for Logic
Audio for Falcon, which takes advantage of the 16 bit 8-channel a/d
convertors and dsp chip, to allow for audio to be recorded on the hard
disk in sync with the midi sequencer.
Regards,
Tom

2495. NEODESK 4 News...!!

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 02:32:00 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <3315j0$p6i@golem.wcc.govt.nz>
Source record: 181936
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well I don't know if this got to atari.announce,
so I will post a copy here...

This was found on GEnie to-day.....

For Immediate Release 8/17/94

Gribnif Software is proud to announce the completion of the most
recent upgrade to the original desktop replacement for Atari computers,
NeoDesk 4. The wait is finally over.

NeoDesk has hundreds of features, so here are just some of the more
popular ones in the new version:

o A completely new "look and feel", including 3D windows, enhanced dialog
handling, and the ability to have multiple dialogs open at once. All
this works on any Atari computer with any ROM version.

o Multicolored icons - each icon can have up to 16 colors, and can even
appear completely different when selected.

o Icon Editor - This multiple window Icon Editor lets you edit and modify
custom icons for any file or folder. The editor can read many popular
icon formats, including ones from other platforms!

o Any Degas, Neochrome, Tiny, IMG, or BMP picture can be viewed (by
double-clicking on it) or can be used as the desktop background.
Desktop pictures can even be "tiled".

o Each directory window has its own menu bar, making it much easier to
find frequently used options.

o Each window has its own "parent directory", Show Info, and trashcan
icons.

o Items can be selected from the keyboard, including a search mode.

o File Groups - Now you can arrange commonly used programs and data files
together in the same window, even when they are physically contained in
drastically different locations! Their names can even be changed,
using up to 20 characters.

o Font Control - NeoDesk 4 gives you the power to redefine what fonts
and point sizes are used within its windows, and even for the text
underneath icons.

o Disk copy, file operations, and floppy disk formatting can all occur "in the background", allowing you to use your computer for other tasks at the same time.

o Search Files - Easily search your system for one or more files, based on their name, size, date, or attributes. A file group can even be created containing the results. This is just one example of the powerful Filtering options which are also available for file operations.

o Compatible with all Atari computers, in all resolutions, including third-party graphics cards.

NeoDesk 4 is available for just $69.95 plus $4.15 S&H. Owners of NeoDesk 3 can upgrade to the new version for $25 + $3 S&H by sending us both original NeoDesk 3 master disks. Backorders are being filled right now, and may take 2-3 weeks to complete.

(Shipping amounts listed apply to orders shipped within the USA only. Please contact us for other areas.)

] o Multicolored icons - each icon can have up to 16 colors, and can even
] appear completely different when selected.

Only on machines with decent graphics modes though :(

] o Any Degas, Neochrome, Tiny, IMG, or BMP picture can be viewed (by
] double-clicking on it) or can be used as the desktop background.
] Desktop pictures can even be "tiled".

Woohoo! Finally I can get the wierd looking BMP's I've made onto the
desktop on my ST! :)

] o Each directory window has its own menu bar, making it much easier to
] find frequently used options.

I hope that can be disabled. In 640*200 I need all the space I can get!

Something NEOdesk needs is a "Files read from source" counter while copying,
as copying hundreds of files with lots of RAM, you don't get a great idea
of how much has been read in yet! Also, an option to continue file
copying after one has been detected as corrupt would be good. (Maybe there
is but I haven't picked it out!)

Also, something I couldn't spot in the Neodesk manual was that if you hold
down ALTERNATE when NEODESK.EXE is executed by NEOLOAD.PRG it will be
bypassed and drop to the normal desktop. Handy if you need a fraction
more RAM & in a hurry! :)

2498. Mega STE for sale

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 03:34:53 UTC
From: rgabour1@sol.UVic.CA
Message-ID: <rgabour1.777267293@sol>
Source record: 181938

For sale:

Atari Mega STE, 16 MHz 68000
105 MB Quantum SCSI hard disk
4MB RAM
Single floppy disk
Atari SM124 mono monitor
Loads of software, including:
Atari developer's documentation (4 big binders)
Mark Williams C / C source debugger
etc.

This system is in excellent shape and has never caused any problems.
I would consider offers in the area of $1000 Canadian.

If you have any questions, call me at (604)472-2175.

Roland

2504. Software for Sale

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 06:24:00 UTC
From: caude@comtch.iea.com
Message-ID: <caude.15.0006669C@comtch.iea.com>
Source record: 181859

I also have some software for sale:

Atari ST Software
=================
XFormer Software & Cable (Atari 800/XL/XE Emulator)
GFA Draft Plus
IBM DOS 3.3 (for IBM emulators)
Ultima IV
Planetarium
GFA Basic 2.0 and 3.0 w/ ref manual
UltraScript
BBS Express! ST 1.79

If you are interested, make an offer and its yours. I (Chuck) can be
reached at:

509-235-8746 (voice)
caude@comtch.iea.com (InterNet EMail)

2505. Re: looking for Data Bases Management System sources

Newsgroup: comp.sys.atari.st

Source record: 181947

Try ftp sites with PC source code on. There are several package sthat I have seen in C which implement multilayered database functions from low level upto front ends. I can't think of any particular ones right now but the port should be trivial. Last one I looked at had make files and switches for DOS/Unix so adding ST shouldn't be too hard.

2506. Papyrus Gold: first opinions

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 09:17:22 UTC
From: mike@divsun.unige.ch
Message-ID: <1994Aug19.091722.6765@news.unige.ch>
Source record: 181948

There has been a lot of discussion about WPs recently; as I am just switching from Redacteur 4 (en francais) to Papyrus Gold (Eng.), I thought a few comments may be of interest:

Papyrus plusses:
Installation was very painless (with SpeedoGDOS 4.1). [I cannot yet say for GENEVA, cos I cannot make GENEVA and Speedo cohabit].
Works very nicely with WINX2.2.
Speed is very acceptable on a TT, once you have turned on the font caches. Takes a little while while loading, to load the outline fonts (just time to open your chocolate bar). (Also, surprisingly, speed is OK on a venerable MegaST: but you can make coffee while it loads the outline fonts! It does have an ancient ROM...).
Screen display (TT-VGA, on Atari monitor) is very good, and aesthetically pleasing.
Very easy to make attractive layouts for reports, letters etc very quickly. Nice template system for different layouts. Printed output is excellent on my SLM605 - really surprised me!
Graphics handling seems good - did very well at importing, handling, and printing Easydraw .GEM files.
I will soon plug in my HP1200 colour deskjet, cos the colour possibilities look really fun too!
English dictionary (I bought from Hisoft - thanks for the great service!) is good, and spell checking pretty quick. You can have it permanently switched on, too, but I haven't tried that yet (I work mostly in French, and am slowly building my own dico).
Table functions work well, once you get the hang of 'em. But I cannot work out how to align figures to a decimal tab. I managed it once, but how?

Minusses (more or less in order of importance):
1. MACROS - MACROS - MACROS ! Please, I need to be able to set up macros quickly and easily; for both phrases and single characters (eg "Send copy for information to:", or typing "mu" at the current point size...).
2. Keyboard programming: circumflex accent; single Greek characters; bullets, etc.
3. It's nice to be able to save styles to function keys: but could these _toggle_ like the predefined ones?
4. Better short cuts for moving and deleting (Redacteur is fabulous for these): delete/select word L/R, line, sentence, para.
5. Option to print header/footer on first page _only_; very important for putting your phone number on letters!
6. The icing on the cake - how about being able to redefine all key short cuts, like in Calamus SL :) ?
7. (As has been mentioned before here): french dico. please!

Overall - well done Christian! Papyrus is quick to set up good layouts,
has superb output, and editing is reasonably quick; but it needs a few more
tools (notably macros and better "delete" commands) to match Redacteur for
speed and ease of text editing.

It's just a sum over 16bit words modulo 2^16. But you can let
Protobot() do it for you, just pass it the prepered buffer with all
parameters set to -1 except for the first(?) that specifies if the
bootsector should be executable. Then it will only change the last two
bytes to make it the right checksum.

Both are on sector 0, the partition info and the booter, but the
booter is free to load more sectors from disk. It is usually only a
tiny program that loads the real disk driver from some file, but this
depends on the driver. The TOS never reads more that one sector from
the hard disk during booting.

Apparently Papyrus doesn't yet work with Geneva; ROM doesn't have a
copy of Geneva to test Papyrus with.

[lots of plusses deleted]

>
>Minusses (more or less in order of importance):
>2. Keyboard programming: circumflex accent; single Greek characters;
>bullets, etc.

Get Pascal Fellerich's (spelling?) CKBD_13 from atari.archive. It
gives you deadkeys, compose keys, and so on. Just type 'e to get
e-acute.

It would be nice though to be able to get to some of the extra Speedo
characters from the keyboard, like curly quotes, em and en dashes, and
so on.

>5. Option to print header/footer on first page _only_; very important
>for putting your phone number on letters!

Do this by setting up an extra master page for page 1 which looks like
your other master pages, but without the header and footer...

>6. The icing on the cake - how about being able to redefine all key
>short cuts, like in Calamus SL :) ?

This will happen. Christian is on the gem-list discussion group which
is defining a way to allow apps to get key shortcuts from a global
file (and lots more besides!)

>regular terminal program) and run the small host program. At that point,
>you can open more terminal windows on your ST. Data to and from them will
>be multiplexed across the single serial line.

How interesting! I have written almost the same thing myself, unaware that
anything similar existed. It's hard to be original, isn't it?

My program duo seems to do exactly the same thing as Unix Windows (judging
from your description of it), with the minor differences that it emulates a
vt102 (fairly well) and adds a compression scheme for downgoing text, which
roughly doubles the perceived speed of the terminal, for average terminal
use. This was a mere survival hack since I couldn't afford anything faster
than a 2400 modem.

The program, Terminus, never was intended as anything but for my own
personal use, so, using a gross euphemism, it was not written with
portability in mind. Only if there is notable interest in the silly thing
I'll consider cleaning things up and writing docs, if I have the time.

VF> switch yet.

There's no version of the original Creator/Notator SL that runs on a Macintosh. There IS, however, a Mac version of EMagic's LOGIC (originally Notator Logic) that will load and convert over your old .SON files from Creator.

Look into it. I've got Logic version 2.00 for my STe, and after playing with it for awhile I have a feeling that I may not need to use SL anymore - it's quite powerful and has a lot of advantages over SL.

2517. Legal questions about ST emulators

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 15:04:51 UTC
From: david@meridiantc.com
Message-ID: <CusF84.2En@meridiantc.com>
Source record: 181868

Hello...I have a quick question about ST emulators. What is atari's stance on emulating the TOS in software for an emulator running on a PC or some other machine. I am just curious why most emulators require you to have the ROM chips for the computer you are emulating. Is this a legal thing, or did they just to it to make their jobs easier? If Atari does allow for emulation, do they charge for it?
Thanks,
david@maxwell.meridiantc.com

2522. a.a.u.e upload - Analog style sequencer

Newsgroup: comp.sys.atari.st
Date: 1994-08-19 15:28:28 UTC
From: cf580@city.ac.uk
Message-ID: <1994Aug19.152828.3130@city.ac.uk>
Source record: 181865

Hi all. I've uploaded a file (anlogseq.zip) to a.a.u.e - it should end up in the Music directory.

Basically, it lets you generate repetitive patterns over MIDI, much like early analog sequencers. It's quite fun, but at the moment not very advanced. Still, if people like it I've no doubt it can be further enhanced.

N.B. - It's written in STOS, and therefore unlikely to work on anything other than ST/STe's. Perhaps someone could try it? And it also requires a Mono monitor (although it should work under emulation) and (obviously) MIDI instruments.

I'm pretty sure we documented this in the read_me for NeoDesk 3.0x.
Geneva has the same type of "abort loading" support.

I just finished teh 0.99beta version of CD-Access, and patched a minor bug in ST-Keep (ANSI colors were a bit off). Both are available for FIDO file request at 1:106/6969.0

CDA_099B.ZIP is the CD-Access package.

STK_ANSI.ZIP is the patched BBS.PRG file.

If there is any demand I'll upload them for FTP, as soon as I find out how. <GRIN>

have ultima 3 and 4 by origin on the atari. They have midi support built
into these two. I was wondering if anyone knows if ultima 1 or 2 had midi support. The reason that I am asking is that Origin has no idea and I can't find these two games anywhere. If anyone knows where I can look I would appreciate it.

No problem Sam.

>
>BTW, ExtenDOS is excellent and one of the most tested and upgraded
>programs currently available.
>

Says who ?
It's not that i don't want to pay. And if i had the chance i could test
it at a dealer shop. It's just that most often when we see an artikle about
some piece of software, it has been tested on another machine running
other applications, and probably with some other hardware equipment.
And i'm sure about 70-80% of software (good software) not running is due
to problems running with other applications.

Only one thing to do, test it on you'r own equipment, otherweise you'll not
know if it'll work.

I use the program 'screen' on the unix box. it offers all you could
possibly want (except multiple windows on your screen, but you can
toggle between the different login sessions with a keystroke).
In my opinion there really is no need for Unix Windows or any such
program: use 'screen'.

I certainly have notable interest in a faster, more stable multi-window serial communications package! I seem to remember making several attempts at getting the source to one of the Unix Windows versions released so other netters could debug it and add features, but to no avail. Also, there was some talk about this functionality being added to CoNnect, but it looks like FAX stuff will come first. Thus, Unix Windows is still the only game in town.

I hope others will support this idea. I'd really like to see your stuff!

>FAX stuff will come first. Thus, Unix Windows is still the only game in
>town.

Unix Windows source is readily available. I believe I got mine from
atari.archive. The old MiNT Windows program MW2 stole a bunch of source
code from UW. At one point I considered adding the UW terminal code to
MW2, so that you could have multiple ST _AND_ Unix (vt100) windows going
at the same time, but I never finished this project. MW was just too
slow.

Instead, I made some changes to UW so that it would compile with gcc and
then hacked on it a bit, mostly to make it work better with emacs. I
also made a few other changes, but I don't remember now what they were.
They were too much of a hack to make generally available.

I used to use UW quite a bit, but I haven't done so in a long
time--mainly for speed reasons. For me, the program was quite stable. I
considered trying to speed up UW's text display, but this appeared to be
FAR from trivial. UW does not use v_gtext at all, it blits each
character bitmap to the screen using vro_cpyfm (as I recall). I think
some heavy-duty assembler would be required to speed things up, and that
was more than I was willing to get into.

I haven't been in here for awhile, I defected to a Mac 8^(but still
use one of my two STs in my MIDI setup (my youngest kid plays games on
the other).

Is this really true? What about all that blather coming from Bob
Brodie et al. earlier this year about the company being "serious"
about the Falcon? Can't say I'm too surprised, but it still is a
drag.

How is the repair situation? I don't have the $$ to convert all my
MIDI software over to Mac versions, if my ST goes belly up, can they
still be fixed?

Bob Brodie quit Atari recently - no word yet on why. My guess is it has a
lot to do with Bob's stating that Atari was gung-ho on the Falcon, and then
the Tramiels turning around and making a lier out of him. I could be
wrong, of course; with no one saying anything, it's just guess-work.

>If Atari had done some real advertising in the past five years, they
>probably would still be making Falcons, so I think Atari management should
>be tied down and forced to listen to that statement for a couple of days.
>:-)

reply
ing to this is tricky is because I want to agree with you, but advertising
was not the answer for Atari.... a single computer company would find
it really hard to compete with several hundred PC manufacturers (resellers)
who take off the shelf technology and sell it. They are advertising for
themselves primarily, and secondarily for the PC style computer. This
built in support/peer pressure system is something that I would not
want to combat as a computer company who spends their own money for
specialized R&D and manufacturing.

Its a hard system to beat, and blaming Atari is not really focusing
the reason of the fall of the Atari computer.... hundreds of OEMs and
manufacturers VS one company... whew.

Not to say that regularly upgrading video/hardware/cases/prices
would have hurt. The TT030 is a really cool computer, but imagine if
they had upgraded the video and base harddrive configurations in response
to the technology getting cheaper as time went on. Killer!

Well, with the new CaTTamaran2 (~58MHz!) you can get 75% of the
CPU speeds of the Medusa for ~$150!

I posted a little while ago about 2 520 ST systems I want to get rid of. I'll take just about any price offered. Below is a complete list of all the atari items I have. Mail me telling me what you'd be willing to pay for any/all of the items.

List of Atari equipment:

Monitors: SM 124 (mono)
SC 1224 (color)

520 ST (1 meg ram) w/ mouse
520 ST std memory (512) w/ mouse

Drives: SF 354 (2 of them)

Printer buffer 64k, Supra Corp.

Avatex 1200 modem.
==========

I'd like to get at least $$ for shipping up front, and then the rest after you received the hardware. Mail me if you'd like anything & how much you'll pay for it (include your destination city too).

kurtphil@phantom.com

2545. Neodesk 4 Here!

Newsgroup: comp.sys.atari.st
Date: 1994-08-20 02:59:00 UTC
From: dan.dreibelbis@f422.n250.z1.tor250.org
Message-ID: <401a7dbd@f422.n250.z1.tor250.org>
Source record: 181894

For Immediate Release
8/17/94

Gribnif Software is proud to announce the completion of the most recent upgrade to the original desktop replacement for Atari computers, NeoDesk 4. The wait is finally over.

NeoDesk has hundreds of features, so here are just some of the more popular ones in the new version:

o A completely new "look and feel", including 3D windows, enhanced dialog handling, and the ability to have multiple dialogs open at once. All this works on any Atari computer with any ROM version.

o Multicolored icons - each icon can have up to 16 colors, and can even appear completely different when selected.

o Icon Editor - This multiple window Icon Editor lets you edit and modify custom icons for any file or folder. The editor can read many popular icon formats, including ones from other platforms!

o Any Degas, Neochrome, Tiny, IMG, or BMP picture can be viewed (by double-clicking on it) or can be used as the desktop background. Desktop pictures can even be "tiled".

o Each directory window has its own menu bar, making it much easier to find frequently used options.

o Each window has its own "parent directory", Show Info, and trashcan icons.

o Items can be selected from the keyboard, including a search mode.

o File Groups - Now you can arrange commonly used programs and data files together in the same window, even when they are physically contained in drastically different locations! Their names can even be changed, using up to 20 characters.

o Font Control - NeoDesk 4 gives you the power to redefine what fonts and point sizes are used within its windows, and even for the text underneath icons.

o Disk copy, file operations, and floppy disk formatting can all occur "in the background", allowing you to use your computer for other tasks at the same time.

o Search Files - Easily search your system for one or more files, based on their name, size, date, or attributes. A file group can even be created containing the results. This is just one example of the powerful Filtering options which are also available for file operations.

o Compatible with all Atari computers, in all resolutions, including third-party graphics cards.

NeoDesk 4 is available for just $69.95 plus $4.15 S&H. Owners of NeoDesk 3 can upgrade to the new version for $25 + $3 S&H by sending us both original NeoDesk 3 master disks. Backorders are being filled right now, and may take 2-3 weeks to complete.

(Shipping amounts listed apply to orders shipped within the USA only. Please contact us for other areas.)

S > Atari has stated that the Atari Computer division is History!
S > The falcon is currently being produced in small numbers. I
S > belive that atari will be licensing the Falcon technilogy to
S > third party.

And, pray tell, where is the press release to confirm this? And the date it was issued? Or is this conjecture based on what "may have been said" or "it has been said"?

And Why has James Grunke, in charge of Atari's Music and MIDI department, been insisting that Atari is still in the computer business - months after the last stockholder's meeting?

All we do know - Atari has given the go-ahead to C-Lab to develop a third-party Falcon MIDI workstation. There's also a new version of SpeedoGDOS out, co-developed by Atari and Compo. Would Atari undertake this if they were planning to cut off the computer division?

All I do know - I'll believe it when I see the press release.

... I get into enough trouble without a tagline!

2547. Roland Sound Canvas E

Newsgroup: comp.sys.atari.st
Date: 1994-08-20 02:59:00 UTC
From: dan.dreibelbis@f422.n250.z1.tor250.org
Message-ID: <1aaf19e2@f422.n250.z1.tor250.org>
Source record: 181896

AG> So that basically means the Sound Canvas is hardly
AG> programmable at all? (I.e., no analog partials to make your
AG> sounds interesting?) Or can it TVF the sample partials?

Well, not quite. The Sound Canvas architecture is designed so you can do some rather neat editing features with the sounds. You can adjust vibrato rate, depth, and delay; attack, sustain, and decay,; cutoff frequency and resonance; poly/mono, velocity offset, depth, keyboard range, and depth range. I've done some rather interesting adjustments of the sounds in the Canvas to turn them into some interesting patches.

However, there are some problems. First, you can't save your sounds as patches or name them in user memory (they will however, retain the settings after you power down). Secondly, any tweaking of the parameters you did on a particular sound will stay in memory and will be applied to the next sound you choose. And thirdly, with older Canvas, you can't access a number of further features in them without sending a sysex message to them (like, for instance, portamento - Roland does have a new operating system chip that fixes that, though.)

What I usually do is do all the tweaking of my sounds from the front panel, and then save them as a MIDI sysex package in the first six bars of the composition I'm working on in Logic. It would be nice, though, if I could do all that from WITHIN Logic (either as a desk accessory, or as a Logic .LOG configuration file with sliders and dials!).

Oh, and among the other neat things you can do via sysex (which I'd love to do via an editor) is you can go into the drum section and edit each drum for panning placement, reverb level, and overall level. As well, you can send out a sysex package either as an overall setting of the system, or have individual sysex packages for each channel (so theoretically you COULD have certain patch configurations you like loaded into the Canvas via the computer as sysex.)

Anybody with programming smarts and a Canvas handy by them willing to take on the challenge? :)

(BTW, it seems the editing system Roland uses across its GS/General MIDI range will work with the existing editors, I've heard that Sound Canvas editors will also work with Boss' DS-330 Dr. Synth table-top model as well, so anyone who comes up with an editor should be able to support a heck of a lot of different modules!)

... Technology: Once you can afford it, it's out of date.

The original poster was saying his 1040 STe won't boot in medium rez. The
early STe's (with 1.6, not 1.62) needed a patch program called STE_FIX.PRG
in order to boot into medium rez. This file is most likely missing from
hist AUTO folder.

Hi,

Does anyone out there have the pbmplus package up and running on
an ST or Mega? I have not been able to get the executable of pnmgamma
from archive.umich.edu (or from a few other sites that have the Atari
executables) to work, and my attempts at compiling the whole package
myself have led to countless hours of frustration. I would greatly
appreciate it if anyone could e-mail me an uuencoded copy of the
program (just pnmgamma, *NOT* the whole package), or point me to a
site where I can get a reliable executable.

Thanks in advance.

Gustavo

2555. HD Bootsectors

Newsgroup: comp.sys.atari.st

Message-ID: <334fl8$d11@golem.wcc.govt.nz>
Source record: 181898

There seems to be some confusion about boot sectors, there are no bootsector 0 in a floppy or a hard disk...

Sector 0 on a hard disk is the partition info, a boot sector is the first logical sector, sector 0 is not the boot sector...

What we need is for Claus Brod to read this and to clear these things up...

Whoa!!! Watch what you're saying there! Bob Brodie made
it quite clear why he was quitting -- he wanted to spend
more time with his family and found another job (at a
NeXTStep developer) that would allow him to do more work
at home. Just because he didn't send you personal Email
about it doesn't mean NOBODY is saying anything (almost
everyone on GEnie knows). <grin>

The Tramiels would welcome him back if he ever wanted to
come back. Also, Bob still visits Atari HQ now and then.

When last I heard, it was commercial - up to version 2.3 or something like that.

There are shareware versions of the program - called Diary 1.9 and possibly even EdHak...don't know where to find them on the NET but I do know that disk vendors in the US carry them, so they are available.

Just a note - the shareware versions usually limit the edit buffer to 8kb si

Free Software Foundation's GNU dbm (gdbm) library is great; a port for
GNU C and MiNT is on atari.archive.umich.edu in Mint/Libraries (or is
that Mint/Lib or Mint/Library)...

Source code is available on all your favourite GNU sites.

2562. Hard Disk Problems. HELP!

Newsgroup: comp.sys.atari.st
Date: 1994-08-20 15:02:51 UTC
From: fvkampen@cs.vu.nl
Message-ID: <Cuu9ss.LyB@cs.vu.nl>
Source record: 181801

Hello,

Once in a while I check my hard disk. And sometimes
(for no apparent reason) it complains about orphan
files, and files that share one ore more clusters.
I have really no idea what causes this.
I first check it with blitz_hd. It sais it cant read
a subdirectory at sector bla bla. Then I check it with
it STTOOLS and it sais there are orphan files. I repair
the orphan files and go back to blitz. It then complains
there are files that share one ore more clusters.
I then copy all the files of my Hard disk to a new folder.
Then I remove all the files (exept that folder) and move
everything back. All the problems are gone. (Of course
there is the risk that some files may be damaged, but
I have never come to that problem)
The main problem, of course, is: What couses this to happen?
I have the idea that some old de-crunchers (like arc) do
something very weird stuff. I know that a copy of tar (detar)
is very buggy concerning detarring files. Is this the problem?
Any body have the same stuff?
I use an Mega STe, TOS 2.6, and AHDI 5.0?
A newer version of AHDI perhaps?
I don't know.....
HELP!!!

Greetings

Look on atari.archive.umich.edu in the /Network directory. In addition to
software, there should also be a FAQ that will help you.

2564. HP Deskjet on MSTE

Newsgroup: comp.sys.atari.st
Date: 1994-08-20 16:53:09 UTC
From: RICHARDSON@sscl.uwo.ca
Message-ID: <RICHARDSON.12.2E5634F4@sscl.uwo.ca>
Source record: 181803

I have access to a deskjet to print some stuff out, since my star 24 pin seems to be ill at the moment. I am hoping to use Calamus 1.09, Redacteur (or Word Writer 2 as a last resort), and Firstgraph. I thought I had a calamus driver for a HP Deskjet 500, but all I can find is the BJ10E driver...does anyone rememebr if calamus comes with a HP500 driver, or failing that where one can be found? Also, has anyone used a deskjet with redacteur or firstgraph? Can I expect trouble? Any thoughts on these packages and their compatability, or others that do definitely work would be appreciated :^)

I would LOVE to see it. I've been finding tons of MPEG's on the internet
here but with my present MPEG viewer I ignore them. It does only 1 fps
and it's not worth the wait. Besides, I knew if anyone could do a good
(great ?) viewer, you could.

S > third party.

And, pray tell, where is the press release to confirm this? And the date it was issued? Or is this conjecture based on what "may have been said" or "it has been said"?

It is worded a bit too strongly, but the relevant pieces are from the Atari Corp. 1993 Annual Report.

Page 6 on the Falcon030:

"... the Company has shipped small quantities of this product. The Company does not expect sales of this product to be material in the future"

Page 6 on Other Products, including the St, TT, XE, 2600 and 7800:

"As a result of these inventories being technologically obsolete and noncompetitive, the Company has written off these inventories"

Page 10 on Competition:

"Several of these competitors have longer operating histories, greater financial and technical resources, broader product lines and larger market share than the Company. No assurance can be given that the Company will have the financial and other resources or the ability to maintain the technilogical knowledge and innovation necessary to continue successful competition in these markets."

I believe I just did.

: It's not that i don't want to pay. And if i had the chance i could test
: it at a dealer shop. It's just that most often when we see an artikle about
: some piece of software, it has been tested on another machine running
: other applications, and probably with some other hardware equipment.
: And i'm sure about 70-80% of software (good software) not running is due
: to problems running with other applications.

: Only one thing to do, test it on you'r own equipment, otherweise you'll not
: know if it'll work.

Regarding ExtenDOS with a Falcon, it works I am using it.

If you have fears of incompatibility with software on your system, just ask.
Post your TOS version, memory size, Auto folder apps, etc. and ask if
anyone has has a problem with this configuration.

example: Does anyone know if ExtenDOS works with a Falcon 14MB, TOS 4.04,
NEC 3xp CD Drive?

Answer: Yes, it works fine.

Sam

As far as I know, the earlier versions of EdHack were either shareware
or freeware (can't remember which), but the later versions were/are
definitely commercial. I don't know where you can get a copy though.

You could also try the gnu dbm system. (gdbm).
It should be available on atari.archive.
If not, I know I compiled version 1.5 right off the GNU cd-rom without
having to change a bit. (This was with the mint libraries and gcc)
Therefore, you could probably get the source code from any ftp site that
stores gnu stuff (which is probably most of them... :-)

Hope this helps,
Erling

Well, again. I will try to make this clear to you and others.
Both Claus Brod, and I, have written auto-booting software for hard-disks,
so I guess we do have some knowledge about the subject...

Sector 0 on a floppy is a boot sector. That we agree on , yes ?
Sector 0 on a hard disk contains boot code AND the partition map info.

What one regularly names "boot-sector" on a hard disk, is sector 0 on a
partition. This one has the same structure as sector 0 on a floppy disk.

OK ?

sB> What we need is for Claus Brod to read this and to clear these things up.

Well, I hope I just did...
Claus, do you agree ?

2580. My Letter in ST Informer

Newsgroup: comp.sys.atari.st
Date: 1994-08-21 03:40:50 UTC
From: scotty@cais2.cais.com
Message-ID: <336ic2$27s@news.cais.com>
Source record: 181818

I started reading this rather incoherent and disjoint letter in the new issue of ST Informer (August) this week, only to drop the issue in shock after seeing my name at the bottom!

I know that Informer edits its letters (you can hardly read them without seeing the warning a few times) but I thought the editing was for brevity -- not to put a nice sugary coating on the content. For those who have the issue and are interested, please compare the two. I'm following this up with the 100% original uncut letter.

My intention was to point out some glaring errors in Mr. Vicha's "Watch me Reveal the Internet" article, which was five parts enthusiasm and one part complete misinformation for each useful paragraph. After Informer got done with my letter, it looked more like "Gee thanks guys, totally marvy, but there was a teensy boo-boo or two!"

Well, here's the original. Note that my email address has changed in the four months it took them to print their interpretation.

==========
Scott R. Chilcote
scotty@cais.com

To: st-informer@genie.gies.com
Subject: Letter to Editor
Date: Mon, 18 Apr 94 17:18:45 -0400
From: scotty@sarge.hq.Verdix.COM

Dear ST Informer:

I'm grateful to Mr. Donavan Vicha for the number of useful articles he writes for ST Informer. After reading his February '94 article called "Surf's Up! Checking out the Internet", however, I fear he's sacrificed some quality for quantity. As a service to your readers who may be interested in becoming Internet users, I'd like to respond to a few of the points he makes in error. As a computer engineer who began Internetting in '86, I feel up to the task.

Regarding the history of the Internet, the actual story is much more interesting than "a bunch of universities wanting to share information." The underlying mechanisms on which the Internet is based grew out of government research into computer networks that could survive massive interruptions (can you say "A-bomb"?). The higher education angle came in when the National Science Foundation wanted to provide five supercomputers for academic research, and created five regional networks to access them across the continental US, in the late eighties. Other details can be found in several references; I prefer "The Whole Internet User's Guide &

Catalog" by Ed Krol (O'Reilly).

Mr. Vicha seems to confuse Kermit with the Internet when he says "I have a lot of respect for true Internet surfers because Kermit is such a bare-bones terminal program." Kermit is a file transfer protocol; a file serving program by the same name is shipped with many Unix systems. It has nothing to do with the Internet other than being an outdated way to download files obtained from Internet archive sites. I personally prefer zmodem. It is not hard to find the source for zmodem, compile it on a host machine with an Internet connection, and to thereafter have much faster file transfers!

The sentence "Internet itself is a fairly bare-bones, text oriented interface..." is very misleading. The Internet is not an application; it is a very large computer network, as Mr. Vicha knows. It is the programs that access Internet resources that provide the interface, and they are improving. Mr. Vicha should check out the X-windows based World-Wide-Web browser called "Viola", available for download from info.cern.ch in Switzerland. This hypertext based Internet browsing tool has a user interface that will curl his toes! Unlike commercial online services, which develop software so that PC and Mac owners can have a graphical user interface, the user-supported Internet has a less coordinated, but more varied bunch of software interfaces. Hopefully this was Mr. Vicha's point.

In his section on "Addresses" Mr. Vicha leaves out vital information about what Internet addresses mean. It's important to know that an address that ends in .edu is from a University, and .com is from a business with Internet access. There are several for foreign countries as well. There are also numerical Internet addresses, the use of which should be avoided if possible. Again, the books do a good job of explaining these for new users.

Lastly, on the subject of Atari Telecom Programs and the Internet, Mr. Vicha implies that function keys and cursor keys are needed for Internet access. This is most obscure. If the host system he's using requires function keys, such as that found in VT100 or VT200 emulation, then that might be the cause of his problems. If so, there is an easy fix. He needs to get ahold of Uniterm (for standard STs) or Connect (for TT/Falcon), each of which provides three full sets of function keys (standard, shifted, and alt-ed). He can then download the list of VT100 function key codes, and program them as macros. For instance, if the VT200 code for F22 is ESC [22~, he can program a shift-F2 macro to send this sequence by entering the macro as ctrl-] (escape) [26~.

His only other sins are those of omission. For instance, the Archie database wasn't mentioned (where to find programs on the Internet). The huge archive of Atari software at the University of Michigan wasn't mentioned, nor were others in Germany and Great Britain. The Network Information Center (NIC) was left out, and the Newsgroup Archives at MIT went unmentioned.

Perhaps there'll be future articles? The Internet has helped this Falcon owner keep up with the "state of the art"; the more other ST users find out, the less they'll be likely to consider switching to a less interesting piece of hardware!

Atari has stated over and over again that they are focusing their attention to the Jaguar and that attention to the computer side is negligible, if that.

Do you seriously think that Atari will issue a press release to the public to that effect? It won't happen anytime soon. The computer division may not be dead, but it's on life-support only and the doctors aren't checking in on the "patient" all too often to check vital signs.

It was none other than Benjamin Joab that wrote on 18 Aug 94 that ,
BJ> Actually, R and D for COMPUTERS has shut down. They still produce
BJ> TTs in small numbers. Falcons are nothing. They are dead.

What are you talking about , Falcon's are cheaper than TT's ,have a more recent TOS revision ,when upgraded to 32Mhz are as near as damn it as fast as TT's and have far superior sound capabilitys .... the only think the TT still holds over the Falcon is 32bit RAM and graphic card expansions ...both of which cost a bloomin fortune !

Atari themselves may have shut down R&D but plenty other companies haven't and Atari if I am not mistaken are taking these companies on board much more than in the past . The net result if this continues could well see more and 'better' products rather than less !

I refer in part to Compo taking over Speedo , C_LAB being licensed to do some work on the Falcon and rumoured also that Overscan's 040 board getting some sort of Atari sanction. The later product will likely blow away any weakness's the Falcon may have v's the TT.

A recent UK show saw none of the exhibitors I saw go home with a Falcon and plenty of users with a new machine . If Atari had the money to promote these machine they'd be dangerous :-)

2585. Speed of Light supports MONO!

Newsgroup: comp.sys.atari.st
Date: 1994-08-21 08:28:31 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <CuvM80.543@beaver.cs.washington.edu>
Source record: 181822

I just wanted to let everyone know that the next version of Speed of Light (version 3.7?) will support monochrome graphics modes. This is partially so that users can start from medium resolution. Basically, the dialog boxes no longer REQUIRE 16 colors, they just look better with them. I wanted to just switch to LOW resolution from medium res., but I tried, and GEM does NOT like to draw all 16 colors because even though the resolution is "Low res" the VDI still thinks it is in medium. So, I just draw all the dialogs and stuff in medium resolution (black and white) and then switch to low res only when drawing the image. As a nice side effect, this also means that SOL 3.7 will now work in monochrome modes (dithering is a must, of course!)

So, if there are any monochrome users out there who wished they could use Speed of Light, check out version 3.7, to be released in a few weeks. Other features include a Slideshow option, some DSP JPEG code for Falcon, and many nasty bugs fixed. Speed of Light is Shareware, please register!

2586. Dr.T's OMEGA Question

Newsgroup: comp.sys.atari.st
Date: 1994-08-21 08:42:16 UTC
From: dritter@wimsey.com
Message-ID: <dritter-2108940148480001@pme06.pomo.wis.net>
Source record: 181823

I have recently had the an opportunity to create some GS/GM (i.e. Roland Sound Canvas) midi files.

I used Dr T's Omega sequencer, adding copiuos amounts of sysex data into the sequences (to change reverbs, set random pans etc.)

When I saved the files as Standard MIDI files (to export to one of those "other" platforms), the good doctor's code relentlessly stripped all of my sysex data out of the sequences.

Does anyone know of a program that converts Dr. T's .ALL files to SMF WITHOUT stripping the sysex data? How about an ST sequencer that loads .ALL files, then allows you to save SMF intact? ....Just askin'...

- Please email me - dritter@wimsey.com - I'm not a frequent mail reader.

Thanks!

I have been using Calamus 1.09n with a Deskjet 500 for several years. The initial driver supplied with the package here in the UK made a bit of a mess of the margins, I wrote a little patch proggy that fixed this that I imagine, is on a PD library near you. The SL drivers have no such problems and work fine. Just make sure the Perforation Skip DIP switch is off.

H > and making a lier out of him. I could be wrong, of course;
H > with no one saying anything, it's just guess-work.

According to a press release made available to the Atari community via GEnie, Bob stated that the reason he left Atari was due to the fact that he needed to get himself a job that would require much less travelling as so he could spend more time with his family. Apparently going on a vacation with them for the first time in years made him realize he needed to become closer with his children. He made it clear in the release that he was perfectly happy with the performance of Atari computers and still uses them; he even expresses the hope that he may eventually come back to Atari if a good opportunity comes up.

He even went on GEnie for a final RoundTable Conference just to say goodbye (although he'll still have his GEnie account so he won't be totally gone); he revealed he's gotten a job with the company that's producing the NeXTStep operating system. According to most Atari-watchers, that was proof he left on good terms, as most employees who've left the Tramiels' employ usually clean out their desk and get the hell out PDQ without much as a peep!

Just to clear the air - if anyone wants, I can post the official release if you want to see it.

Source record: 181831

Tom:

I used to have the GFA Assembler master disk as it came with the MAGE game development system I worked on.

However, I still have the GFA special offer which lets you buy the full version of the GFA Assembler (with docs) for only $50 (at least a third to half off retail).

Now, I don't know if the offer still holds but if you e-mail me your address I will mail the form to you - heck its worth a try.

GFA Assembler is very nice - problem is I don't know a lick of 68000 code, only 8088 Assembly (a little).

5M> It is worded a bit too strongly, but the relevant pieces are
5M> from the Atari Corp. 1993 Annual Report.

<pertinent and useful facts deleted>

Daryl - thank you for uploading these little bits from the Financial Report. It makes things a bit clearer now. Obviously (to me anyway) it looks like Atari is being rather cautious in what the outlook will be for the future of the computer division , rather than coming out and saying "we're not making any more computers, so there!"

After reading all the contradictory reports that I'd seen ("they're only making TTs - the Falcon is screwed!" "they're only making Falcons, the TT is screwed!" "They've up and quit making anything - we're all gonna die!"), it was good to actually see what is going on.

Then again, it could all be doublespeak :).

In any case, let's hope the Jaguar becomes enough of a hit so we Atarians could possibly breathe a little easier - or that a killer application comes along so that the Falcon becomes a MUST-HAVE! Even if it's in a niche market like MIDI.

Again, thanks.

Dana @ STReport International Online Magazine
VVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVVV

Then again, seeing that this reply is coming from one of Ralph Mariano's cronies at ST Report (which is nothing more than Ralph's personal vendetta against Atari Corporation and anyone who has "wronged" him after being caught with his pants down again and again - his own history and behavior speaks for itself regarding major historical revisionism) I am quite disinclined to believe you or consider your opinion valid.

Rest assured that though I do seem to be "wearing rose-coloured glasses" in regards to my support of the Atari platform, I do tend to take them off from time to time. :) The fact is, I need fact - not conjecture, may haves, might bes, might have been said, a friend of a friend told me, FACT. You may tell Mr. Mariano to take this into account when sitting down to write another one of his "scinillating exposes" of Atari and related developments. If not, perhaps he should get a life.

I AM quite aware of the precarious position Atari is in right now - and am quite aware of the turbulent history of the computer division under the Tramiels' management. But I'd rather get the facts straight here from people who are interested in seeing Atari's survival, and not from people aligned with a man whose sole aim is to bring down Atari's downfall as an act of petty revenge.

... OH NO! We're gonna get SUED!

Hello There!

A few days ago a user named Cor Kalkman did upload me a Trojan Horse virus
on my Bulletin Board.

Watch out for a file named XCELL267.ZIP, 149811 bytes long.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
The user describe it as an Excellent Virus killer better then AVK 6.3
and recognize a lot of bootsectors and link virusses but nothing is true.

After unpacking 3 files are existing:

XCELLENT.PRG (The Killer! ICE-Packed)

XCELLENT.DAT (Looks like a data file but it's nothing more then an
ICE-packed ZIP file with nothing more then the original
pirated Euro version of PC-Ditto!)

README.1ST (A text file with information)

The virus killer doesn't work on TOS 1.4, TOS 4.02 (TOS 2.06 isn't tested)
but it does his job with TOS 1.2 here.

When NO HD is connected you'll get a message that you must reboot your
computer because "there are some resident programms into the memory". If
there's a HD it will cleanup all your files on it!
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

I've tried it with a Ram-disk on a Stand-Alone 1040 without HD and all my
files are gone in the Ram-disk after running it. You'll also get a nice
message that you're a complete idiot.

One of my users has a clean HD now after downloading this file, many thanks to
him for warning me about this ugly file. It's removed immediate from my
BBS in Holland.

All partitions from C: to F: are deleted after running.

This message is also forwarded to some dutch echos, please be carefull.

Greetings,
Koos

"L> will move over to STR which is continuing.
I am just glad that what happened with ST World didn't happen to ST Review ie.
it was combined into the one publication (read: killed off).

Even though ST User wasn't that good it is a shame to see it go, just another
sign of the current market conditions.

Need to ask yourself what the next one will be (ST Format or ST
Applications?)

Spencer

2609. PageStream print problem

Newsgroup: comp.sys.atari.st
Date: 1994-08-21 19:01:05 UTC
From: hurn@shell.portal.com
Message-ID: <33889h$66q@news1.shell>
Source record: 181837

I'm trying to print a pamphlet in 8.5x14" landscape (horizontal) format (have had no trouble doing this with 8.5x11" paper sizes). When I try it in this size however, it begins printing without the .5" designated margin, lobs off 1" of the first column -- the result of which is the omission of 1.5" of the page (probably bi-laterally but I aborted the print process before it got to that point). I designated that the document be 8.5x14" landscape in the dialog, but PageStream just doesn't seem to see it that way.

When I printed a draft page on an 8x11" sheet (at 78%) _everything_ printed out.

I'm using PageStream 2.2 with a 4 mb 1040ST, a Panasonic KXP-1123 printer (Epson LQ-2500 print driver). I also tried the NEC P6 driver with similar results.

Hope someone can help but, if not, is there an e-mail address for SoftLogik? Their BBS software doesn't like the modem I'm now using and automatically hangs up after when I try to call (yes, I'm a registered user but can't find anything in the manual which sheds any light on this).

TIA for any help offered.

- Nancy hurn@shell.portal.com

: is? I keep hearing rumors that they are no longer producing computers, just
: the Jaguar, and then again I hear that they have simply canceled all Research : and
development projects but are still producing the Falcon in small numbers. : Does anyone
know which of these is correct?
: - John Brunner

I'm not real sure about the answer here John. I do know that less
than 6 months ago I purchased a new 1040 STe from Micro Computer Depot in
South Carolina, and John, the salesman there told me Atari decided to
continue making the 1040 STe line of computers. As far as I can guess to
date, Atari is only making 1040 STe, Falcon, and Jaguar systems. I wouldn't
bank on this however, as I recently read a post on Delphi where someone
had a Stacy for sale, and he claims it is only three months old (of course
this doesn't mean it came off the line recently, it could have been in stock
in some store for years).

Source record: 181839

I have a Mega STe with an Atari Modem (I forget what the model number is.) 1200 Baud, I think. I currently subscribe to GEnie, which has provisions and software to accomodate Atari ST computers. Can anyone answer the following questions?:
1. Is it possible for me to subscribe to American On-Line using my Mega STe and Atari Modem? Do I need any special software?
2. The San Jose Mercury News newspaper has a service called Mercury Center, which requires software that only runs on Macintosh or PC computers. This service is tied into America On-Line. Since I can't subscribe to Mercury Center directly, is it possible for me to subscribe to America On-Line with my Mega STe and access the San Jose Mercury News articles?
Please E-mail any answers you may have, or post them on this user group. Thanks in advance. ---Mark van Wyk

I do suguest that you get better Tools and Hard Drive Driver, like ICD Utils
as your Driver software...

There are 2 Utils to clean up your hard drive that I would recommend,
one is ICD CleanUp and Diamond Edge..

Diamond Edge does have a Defrager/Compresser, were CleanUp does not..

There is a good Defrager on the net called Check Disk III, its by Atari and I
have never had any problems with it...

I have never ever trusted PD hard disk utils, you take you like in your hands
when using such rubish....

You only get what you payed for....?

A few things I would like to know, what was the last issue of ST-User.?

Some of these Mags, have offers for most of there Demo cover disks,
to upgrade, how many of these offers still stand, I don't know if ST-User
had any of these offers..??

Its a shame that ST-User has gone, they are one of the fist Atari mags,
but when you look at the present contents, there is a lot missing, they just
did not keep up with the play, mind you the demise of Atari did not help at
all, plus the lack of support..

Just go have a look at the Amiga scene, they still have a good USA magazine,
plus plenty of other ones and very good Internet support...!!!

Even to-day here in NZ the Atari does not exist when compared to the Amiga
scene..

Even Germany that worshiped the Atari has almost closed shop, only one magazine
left I thing...!!!...

Does anyone have a listing of VT100 & VT52/ASCII equivalents?

Such as, what character does the VT100 corner character map to in ASCII?

(the one that looks like:

```
__
|
```

but in a single character. If anyone understands what I'm going on about, any ideas!?

Basically, just what characters I would enter from the 255 character ASCII/VT52 character set to get the various VT100 symbols. (or is it 256 character? whatever). I can do it easily enough with ANSI, but I don't have a similar list for VT100!)

From: bjr2@Ra.MsState.Edu
Message-ID: <338rdg$ve@Tut.MsState.Edu>
Source record: 181758

I recently got a file via FTP that claims to be a GDOS SW clone...problem
is...it has no *.sys files with it and I haven't a clue what to do with
it since I've never run GDOS before. A few questions are in order.

1> What does Gdos allow me to do aside from plug in various GDOS screen fonts?

2> What do I need to get this program running...assuming it is set up just
like GDOS?

I do have tons of GDOS FONTS for use with Notator, and some of the fonts
aquired from FTP sites included ASSIGN.SYS files for use with GDOS. I
tried to install AMCGDOS using these ASSIGN.SYS files with no avail...
got a message saying "No GDOS.SYS file found, Aborted". Basicly, I'm just
clueless as to how to set this program up..and there were NO DOCS with it.
Who ever posted the binary must have assumed that everyone knows how to set
up the SYS files needed to run it.

Clueless,
Brian

2626. Telecom programs for Atari 520ST.

Newsgroup: comp.sys.atari.st

From: Edward Piecewicz <ed_p@delphi.com>
Message-ID: <xo3Qdi5.ed_p@delphi.com>
Source record: 181755

Does anyone know of any public-domain/shareware (fully-working) telecom programs for a "stock" Atari 520ST (TOS 1.0 and 1/2 Mb RAM)?

I have been looking for one with ZMODEM in it, but the only one that has successfully worked on the computer without any problems has been UniTerm 2.0e, which is an older program, and I do not know if it is even supported anymore. UniTerm does not have ZMODEM with it, but at least it works.

Thanks.

ANSITERM 1.90 is what I use. Also, TAZ 1.0 is very good. Both do ANSI
very well, and they do VT100 with the same mode. They use XYZ within
the program. AnsiTerm is the best. All you have to do is say where
XYZ.TTP is, then go D/L. Xyz does zmodem.

>"wronged" him after being caught with his pants down again and again
>- his own history and behavior speaks for itself regarding major
>historical revisionism) I am quite disinclined to believe you or
>consider your opinion valid.

Dan,

I'd expect this type of a response from people who have had problems
with Ralph's views in the past. Ralph has had very little to say
with regard to the Atari coverage in STReport for almost a year now
as he's been involved in the PC platform for about as long. He
doesn't even do the Atari portion of STReport any longer - I do.
I've never had a personal vendetta against Atari Corporation although
I have disagreed with _many_ of their decisions and some of their
[former] employees.

I've been an avid Atari computer supporter for years; now I'm also
a Jaguar supporter. I cover both in the Atari section of STReport
these days. I have first-hand information from Atari employees and
a great working relationship with them as well - something that was
dead a year ago.

Feel free not to listen or believe a thing that I say - that's
your right and privilege. However, it doesn't make those opinions
correct.

> Rest assured that though I do seem to be "wearing rose-coloured
>glasses" in regards to my support of the Atari platform, I do tend
>to take them off from time to time. :) The fact is, I need fact -

As do I. You were presented the facts in others' messages; I didn't
bother to hunt down the annual report with the exact quotes. The facts
remain that what I told you was true and "validated" by others.

> I AM quite aware of the precarious position Atari is in right
>now - and am quite aware of the turbulent history of the computer
>division under the Tramiels' management. But I'd rather get the
>facts straight here from people who are interested in seeing Atari's
>survival, and not from people aligned with a man whose sole aim is
>to bring down Atari's downfall as an act of petty revenge.

If I weren't interested in Atari's survival, I'd get rid of the 4 STs that I have and I'd never have agreed to take over the Atari section of STReport. My goal is to keep the users informed. I realize, however, that there are those like yourself who will automatically assume that anyone associated with STReport, either yesterday or today, will think that nothing's changed with regard to STReport. That's just not true. I will say that Ralph's attitudes have _not_ changed, but he has no input to the portion of STReport that I handle other than to publish and edit.

]
```

That part is point of view. A 10-sector per track floppy could either be counted 0-9 or 1-10. An 80-track disk, 1-80 or 0-79.

Counting from 0 is a lot easier in the computer world, as it what the default values of variables etc. virtually all seem to be, so might as well keep constant!

2631. Memory depletion

Newsgroup: comp.sys.atari.st
Date: 1994-08-22 02:36:47 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <3392vv$hic@golem.wcc.govt.nz>
Source record: 181772

I just wrote a small quote-generator in High-Speed Pascal which works quite well, but I noticed that whener I execute the file, I lose about 30 bytes of memory. Now while this isn't a big problem in the circumstances in which it's being used, it could become annoying. It is ended like this:

```
Close(outdata);
Close(Infile);
halt(0);
End.
```

Outdata is the AUX: (Modem)
Infile is the text-file with the quotes (Input)

Halt-0 supposedly exits the program cleanly with a no-errors result.

End. is required to tell pascal the program is finished.

I know most people will say I should be using C instead of Pascal, but Pascal seems to produce smaller, faster code than the various versions of C I've used, and I'm also much better at Pascal than I am at C. (My limits in C is not much more than the "Hello world" program).

The quoter is a 3k file which scans another 3k data file and then randomly chooses a quote & chucks it through the AUX port....

Bart's Bottom 40 #13: Parents who have signatures that are really hard to forge.

(That's one there :)

2632. GFA FTP sites

Newsgroup: comp.sys.atari.st
Date: 1994-08-22 02:54:10 UTC
From: ross@cscns.com
Message-ID: <Cux1EA.H88@usa.net>
Source record: 181769

Anyone know of any GFA basic FTP sites with source code and ?.
I've found one with STOS and several with assembler and C but no GFA.
I'm surprised that I haven't found a German site with it but then I
haven't checked all of them yet.

Thanks for the help.

Your right, the death of the Atari home computer is premature.

There is no chance that Atari could survive if they tried to hack it
on the ST/TT/Falcon030. I love the machines, but without a serious
redesign and a positive cash flow no company could stay in business.

The Jaguar development will give us a base of technology that no
other PC can match off the line.

Dana is not Ralph. While I won't take issue with your opinions of Mr. Mariano, in the interests of saving bandwidth, I will take issue with your supposition that Dana is somehow Ralph's mouthpiece. I've known Dana online for longer than he's been associated with STReport, and he most definitely has a mind of his own. He has worked hard to make the Atari section of STReport as fair and unbiased as he can (although the same cannot be said of those portions that Ralph continues to write editorially), and has succeeded in building a bridge of communication between himself and Don Thomas at Atari. Don has been very supportive of Dana's efforts to inform the online community of events and developments in the Atari community (computer and game). If Atari is willing to give STReport a second chance, albeit a carefully watched one, shouldn't the rest of the Atari community do the same?

: service is tied into America On-Line. Since I can't subscribe to Mercury
: Center directly, is it possible for me to subscribe to America On-Line with
: my Mega STe and access the San Jose Mercury News articles?

AOL requires special software to access it, that runs on Mac or
DOS/Windows machines. You woudl need an emulator to run the software on
your Atari. (The older Mac software had trouble running under Spectre,
but the newer versions are said to work.)

2643. MasterBrowse 4.7 available

Newsgroup: comp.sys.atari.st
Date: 1994-08-22 09:05:50 UTC
From: vctec@westminster.ac.uk
Message-ID: <CuxIMz.2I3@westminster.ac.uk>
Source record: 181783

MasterBrowse 4.7 has now arrived at

micros.hensa.ac.uk (micros/atari/tos/n/n114/mb47_bin.lzh)

Below is a description and updates list by the author...

Download and Enjoy....
Danny

August 20, 1994

M a s t e r B r o w s e 4 . 7
""""""""""""""""""""""""""""""""""

Copyright 1993, 1994, Michel Forget
Electric Storm Software

There is a new version of MasterBrowse available!

Using FTP, you can get the new version of MasterBrowse (when it is
validated) from either of the following addresses:

atari.archive.umich.edu (/atari/Newitems/mb47_bin.lzh)
ftp.tu-clausthal.de (/pub/atari/Newitems/mb47_bin.lzh)

Both of the FTP sites mentioned above can be accessed using a mail
server, for those who do not have FTP access. The file will also appear
soon (with the name MB47_BIN.LZH) on GEnie, Delphi, and CompuServe. In
addition, the new version of MasterBrowse will appear at micros.hensa.ac.uk
soon.

For those who have never used MasterBrowse before, a detailed
description of the program will follow the list of new features and
bug fixes.

~ ~

MasterBrowse 4.5:

NEW FEATURE: MasterBrowse now has even more powerful windowed dialog box
editing capabilities. The following keys can be used inside
a windowed dialog box:

UNDO = Exit (Cancel)
Return = Exit (Done)
TAB = Next Editable Field
Control + TAB = Previous Editable Field
Shift + Left Arrow = Start Of Editable Field
Shift + Right Arrow = End Of Editable Field

Shift + Up Arrow = First Editable Field
Shift + Down Arrow = Last Editable Field
Control + Left Arrow = Start Of Previous Word
Control + Right Arrow = Start Of Next Word
Shift + Backspace = Delete From Start Of Field
Shift + Delete = Delete To End Of Field

Alternate + [UNDERLINED LETTER] = This will exit the dialog
box as if you had clicked on
the button containing the
underlined letter.

NEW FEATURE: MasterBrowse now has context sensitive online help, if you
use the ST-Guide accessory. If the accessory is installed
on your system, pressing the Shift + HELP key will cause
MasterBrowse to instruct ST-Guide to open a window with
information relavent to your current position. Since all
of the information is external, this option does not affect
the size of MasterBrowse at all, or how much memory it
uses. The entire MasterBrowse manual is available (accessed
by entering the help system while you are NOT in a dialog
box).

NEW FEATURE: When marking a block, the SHIFT key can be used to "continue"
a previously marked block. This means that the start of the
block will remain the same, and you are only adjusting where
it ends.

NEW FEATURE: MasterBrowse now has an "Edit" menu; "Clip Block" is now
"Copy" and "Open Clipboard" is now "Paste". This change
was implemented so that MasterBrowse would be more compliant
with existing (and future) standards.

NEW FEATURE: MasterBrowse now has a "Delete" option under the "Edit"
menu; it will delete the SCRAP.TXT file inside the
clipboard folder.

NEW FEATURE: The keyboard shortcut manager has been completely rewritten;
you can now add and remove keypresses at will, and change the
keyboard shortcut for ANY action (not just menu entries).
MasterBrowse no longer makes any distinction between the
left shift key and the right shift key. The interface to
the keyboard shortcut manager has also been rewritten; it is
now much more user-friendly!

BUG FIX: Selecting "Skip" in the colour configuration dialog box will
no longer cause MasterBrowse to set that colour to white.

BUG FIX: If the text or background colour is chnged, the window affected
is now completely redrawn.

NEW FEATURE: MasterBrowse now has a push/pop position feature; this can be
thought of as a temporary bookmark. You "push" (set) the

position, then "pop" (unset and move to) the position. This
is much faster than setting a bookmark because it does not
cause a dialog box to appear on the screen.

MasterBrowse 4.5a:

BUG FIX: The file selector should not work correctly (again).

BUG FIX: AutoSave Options will now always save the options to the
path pointed to by MB_CONFIG.

BUG FIX: If you have previously registered MasterBrowse, copy your
USERINFO.DAT file into the new MasterBrowse directory.
MasterBrowse will analyze the file; if it is valid, the
"MasterBrowse Information" dialog box that is shown to
unregistered users will not be shown to you. This did
not work (at all) in the last version, for which I
humbly apologize.

MasterBrowse 4.7:

NEW FEATURE: MasterBrowse no longer uses an internal font selector; instead,
it can now interface directly with the Universal Font Selector,
by Michael Thanitz. The Universal Font Selector is much more
reliable than the internal font selector previously used by
MasterBrowse. The MasterBrowse Installation Program will
copy UFSL.PRG to your /AUTO folder automatically, so no extra
effort on your part is required.

NEW FEATURE: MasterBrowse now uses windowed progress displays, so loading
a document no longer prevents other applications/accessories
from executing in the background and it allows you to switch
from one application to another while a document is being
loaded. (NOTE: If you turn off progress displays, the
loading speed will be markedly faster.)

NEW FEATURE: To make using ST-Guide with MasterBrowse easier, you can now
set the name of the ST-Guide accessory. To do this, create
an environment variable called "HELP_ACC" and set it to the
filename (no path and no extension) of the help accessory.

Example:

You would like MasterBrowse to use TEST.ACC, instead of
ST-GUIDE.ACC. Add the following line to GEM.CNF:

setenv HELP_ACC=TEST

If you have Mag!X, you would add the following line to
MAGX.INF:

#_ENV HELP_ACC=TEST

That is all that there is to it. In order, MasterBrowse
will look for HELP_ACC, 'ST-GUIDE', and 'STGUIDE'.

INSTRUCTIONS: The HyperText documentatin has been improved to take better
advantage of the power offered by the ST-Guide utility.

BUG FIX: Selecting "Close All Documents" will now clear the list of
open documents, so you can use the "Quick Access" feature
without getting an error message.

INSTALLAITON: The MasterBrowse Installation Program:

NEW FEATURE: If the destination path you specify in the
installation path contains folders that do
not exist, the installation program will now
create them.

NEW FEATURE: If there is no AUTO folder, the installation
program will now create one on the boot
device.

NEW FEATURE: The destination path no longer needs to be
terminated by a '\' character.

BUG FIX: The file selector will no longer contain an
invalid path specification if you double-click
on an editable text field.

NEW FEATURE: The installation program will no longer
generate an error if the destination file
exists during a copy operation. The old
file will silently be erased.

This is a different story. Let's replace the term `sector 0' with `the first physical sector'. You can easily format a floppy that even does not have a sector 1 or track 0 (not that it would be usefull...), it's just a matter of the contents of the id part of a sector.

During booting, the TOS reads *the first physical sector* from the boot drive (track 0/sector 1 on a floppy, sector 0 on a (scsi) hard disk), and nothing more, and checks it if it contents should be considered as executable code. If yes, then control is handed over to the boot code, which can do whatever it likes (including erasing your hard disk :-))

Well, I've done it. I now have a Falcon. Here are a few questions ...

(1) I bought this computer second hand and it didn't come with SGDOS.
it has an internal hard disk and MiNT + all of the rest of the hard
disk stuff. I believe that I should be able to get it, but how?

(2) Can anyone describe the modification necessary to convert the mic
input to line input?

(3) What is the current version of MiNT available as binary and where
is it?

In answer to your question, what causes this to happen is this;

Fragmentation of files - deleting a file frees some space on the disk.
When a new file is written, chances are it will be smaller or larger
than the file that was deleted. The new file will be written to the
'free disk space, while the rest of it that doesn't fit gets written in
the next free disk 'space'. repeating this results in most files be
stored in bits all over the place, disk read times increase, the drive
has to work harder (more wear and tear) and the chances of file

corruption increase.

If your drive is not too big, it's probably easiest (read: safest) to back up the drive, re-format, and reinstall your software.

Steven.

May a few of the new users don't know this, but from memory this was the very first German program to be brought out in English..

So when is this version going to come out in English, it could be the best egg beater in the world, but if its only for left handed people, then its not much good to the rest of us, is it....????

Come on you Germans, English is main language of the world, so how about supporting it...

Thanks.....

Mikael Hillborg (euahil@eua.ericsson.se) wrote:
: Hi!
: How do I change the size of the MIDI-buffer ?
: I have used the bios (xbios ?) call Iorec which
: returns a pointer to a struct where the size can
: be *read*. However, how can it be written/changed ?
: The default size is 128 bytes i think, and I would
: need at least 1024 bytes.
: I use Lattice C on a 1 meg ST.

I made something like that a long time ago. I remember having some
difficulties when increasing the buffer to something near 40k (no, not
32k). If that's enough, the code below may be of some help. It's not debugged
but I don't think it's far from bug-free.
- cut -
#define OWNBUFSIZ (unsigned short 1024)

struct iorec {
unsigned char * ibuf; /* pointer to input buffer */
unsigned short ibufsize; /* size of input buffer */
unsigned short ibufhd; /* head index */
unsigned short ibuftl; /* tail index */
unsigned short ibuflow; /* low water mark */
unsigned short ibufhi; /* hi water mark */
} *midi;

unsigned char *newbuffer;

void
main() {
/* allocate memory for new buffer */
if( newbuffer = (unsigned char *) malloc( OWNBUFSIZ ) ) {

/* get buffer data record for midi-device, Iorec(2) */
midi = (struct iorec *) bios(14,2);

/* change active buffer */
midi->ibuf = newbuffer;

/* increase buffer size */
midi->ibufsize = OWNBUFSIZ;

/* clear out any garbage */
midi->ibufhf = midi->ibuftl;

} else {
perror( "shiiit" );
```

```
}
}

2660. LaserJet BIOS driver for Calamus 1.09

Newsgroup: comp.sys.atari.st
Date: 1994-08-22 13:31:37 UTC
From: spbcajk@ucl.ac.uk
Message-ID: <1994Aug22.133137.31056@ucl.ac.uk>
Source record: 181701

Does anybody out there have a BIOS-compliant LaserJet driver for Calamus;
I need to spool a document printout to disk (my LJs died and I've got to
get a thesis printed asap so am doing it at work.)

If you have one, or know of where I can get one by ftp, then let me know.

(Yes, I know FaST club have them, but the turn around for an order would
be about three days and I haven't got that long!)

Thanks in advance for any help.

Cheers

> What about MultiTOS? Does NeoDesk 4 work with MultiTOS or better only MiNT?

NeoDesk 4 works with Geneva, MultiTOS/MiNT, and MagiX!. Our plan is to
continue insuring that it works in those environments, even as newer
versions are released (this applies mostly to MagiX!/MagiC, which is
still evolving).

Fellow Atari junkies,

I just purchased a falcon, and a 1 gig hard drive (I sold my 520-ST,
and 1/2 of my stereo.)

I was planning to put the Drive on my NeXT cube (There turns out to
be alot of thing I could do on a 520-ST but not a NeXT!), but wanted
to have a healthy sized partitian for the Falcon on the hard drive
in my cube.

I'm not to much into scsi, but is project feasable?
Is it recomemded? If so, any hints on how does one go about
doing this.

thanks,

Victor White

There is a demo on CIX too, but it is not freely distributable. Now,
there are several BIG fans of NeoDesk 3 (myself included) on CIX, and
we have nearly all concluded that NeoDesk 4 is HORRIBLE. They really
cocked up. Get the demo, and you'll see what I mean. I hope Compo
are forwarding the comments from CIX to Gribnif. They won't be getting
many upgrade orders from us, unless they sort it out.

From: l3464@dc.dk
Message-ID: <l3464.1.00114870@dc.dk>
Source record: 181704

Hi, I'm living in Denmark where prices usually are a LOT higher than anywhere else. Therefore I'd like to check if it would be cheaper in Germany.

What I'm looking for is a FALCON with 4MB and 65->85MB HD. I'd like to know the street prices, and if possibul a dealer.
Should you know the price of CUBASE/AUDIO that would be nice too.

Thanks!

(I dont know the exact currency rates but I think the price in Denmark is just about 2500DM)

>That's all I know, via the notator mailing-list...

The Mac Notator is called Notator Logic, and I think it's also available
for Falcon and maybe even ST. It was done first on Mac, and is not really
an upgrade, but a total rewrite. It is a lot larger, more sophisticated,
more expensive, and slower. (It would probably be unusable on a normal ST).
There is also a Notator Logic Audio, which integrates direct-to-disk
sampling with the sequencer, and is even more expensive. This is
definitely pro high-end stuff, way beyond what most amateurs need IMO.
Logic is put out by Emagic, which I think is owned by Ensoniq. That's
where all the programmers from C-Lab went when it broke up or whatever.

>running it on the Falcon. So now i got two different answers from two different
>systems. Tell me what to believe.

I guess I should just lay this one to rest. There have been a number of
versions of ExtenDOS; I have beta-testers test each one before starting
to ship the next version. The problem that is referred to above is with
a beta test of ExtenDOS Pro. This problem is now fixed. I hope that
no-one is surprised that problems occur in beta-test software.

Released versions of ExtenDOS have worked on the Falcon since version 1.10
(version 1.0 did not, and wasn't designed to). I should add a small
caveat here ... version 1.20 (which added photoCD) does not support
photoCD on the Falcon. This was not by design, somehow it slipped
through. The problem is resolved by version 1.21. I have posted an
update package which updates all existing versions of ExtenDOS to v1.21.

This package is currently on GEnie (I know, not very convenient for
the UK folks) ... I would be more than pleased to post it to the Internet
if you can tell me where. Due to my lack of full access, it has to be
mailed, I can't ftp.

>your Atari. (The older Mac software had trouble running under Spectre,
>but the newer versions are said to work.)
>
>--Roger

Follow up question: I have Spectre GCR. Let's say I could get America On-Line
or Mercury Center software to work with GCR. How would I get my modem to work?
I use FLASH software to run my modem. So, lets say I turn on my modem, and
then boot up FLASH, and dial America On-Line, or Mercury Center, or whatever,
in Atari Mode. Then what? Do I then quit Flash, while still connected to
America On-Line, then go into Spectre GCR Mac mode, and boot up America On-Line
and go from there? Would my modem still work while I'm in Macintosh mode?
Do I need Mac software to run my modem in Mac mode? Has anyone ever gotten a
modem to work like a Mac modem with Spectre GCR? Sounds pretty flaky, but it
might be worth a try, since the Mercury Center software is free. They give it
to you free, and you use it to log on and subsribe. Thanks in advance.

I definitely would have stopped using ataris if it weren't for multiTOS.
It is great, and has several important features that the other OS's for the
atari lacks. However, I agree that the released version (1.0/1.02) of
multiTOS is slow if run on anything else than a Falcon/TT. But, the latest
betarelease fixes that. If only they would come around and publish it...

^^^^^^^^^^^^^^^
Which definitely is the case for MiNT, which is coming with new patches
almost dayly, and with mint-1.11 being just around the corner.
(mint 1.11 will be the first version since 0.95 that is allowed to be
distributed in binary form)

Enough of this, I am more interested in the new Neodesk...

Great, so how about this list - if all important question is answered with
"yes", I will order it at once:

1) Iconify under AES 4.1 ?
(Important)
2) Long Filenames/Case Sensitivity with installed filesystems ?
(Very important !)
3) Works with memory protection enabled under MiNT ?
(Very, very important !)
4) Possible to have some windows with Icon view, and some windows
with text view ? (not very important, just-a-little :)
5) Possible to choose font to use in text-windows ?
(not very important)
6) Number of open windows limited only by available ram/AES version ?
(very important)

That's OK, Roger. I doubt if Bob Brodie would believe anything YOU said, either.

The TRUTH is (not that you seem to put much stock into it) is just what Steve said. Bob quit _amicably_ from Atari so he could spend more time with his family at a job that was much closer to his home on those days he must go to the office. I haven't spoken to him since just after he left, but he seemed happier then.

Unlike many before him that were swept out by Atari's infamous 'revolving door,' Bob left on good terms with the Tramiels. And those that _know_ him will miss him as a true user's representative at Atari. No, he wasn't perfect, but he was the closest thing that we could realistically hope for.

>When ever was stated, is what he wanted for you to hear, weather this is the
>truth is any ones guess..

Trying to insinuate he lied about his situation is extremely childish, IMHO. But I suppose we must consider the source...

I don't know of any ftp sites that have specialized GFA source code areas, although they may exist in my ignorance.

GEnie does have a fairly good library of GFA programs and routines, although most are fairly dated now. There is an active GFA discussion group at CATegory 22, as well.

You have to start up in Spectre and you would have to get a Mac comms
program like White Knight, or possibly America on Line comes with it's
own interface software for the Mac, but whatever you use, it will be Mac
software, as ST software won't work on a Macintosh computer, which is
what you will be using once you enter specter mode

Not so rare, in 1986 I bought a 260ST which was just a 520 without anything... No TOS in ROM, no mouse, a single sided floppy and a boot disk, no modulator either, I had it connected to a Philips green screen mono monitor... The machine was upgraded to TOS in ROM (1.0) a few weeks after... :-) And the memory was 512k not 256 as the name might have suggested... Yep, those were the days... :-)

>data, then they can't stop you!

And it's very simple too !! Just use one bit of every byte of data (so you
get 'only' 255 colors instead of 256) and put in your piece of data. A
simple 'scan' program reads in the 'redundant' bits and recreates your
masterpiece... And you can ZIP or LZH with a password before encoding it
into your picture file and voila, APPGP (Almost Perfect Pretty Good
Privacy) and you can take the 'Pretty' literally when using 'appropriate'
pictures ;-)

>
>
>Clueless,
>Brian

AMCGDOS is installed into you Auto folder, you also have a ASSIGN.SYS
in the root Directory of 'C' Partition, the first real entry in the ASSIGN.SYS
file must point the the GDOS system folder....

Here is a sample part of my STalker 3 comms program...

```
------------------------------------------------------------------------------
; ASSIGN.SYS for STalker 3 = Comment line..!!!
;
PATH = C:\GEMSYS\ ;GDOS fonts are loaded from here

01p SCREEN.SYS
02p SCREEN.SYS ;ST low rez (320*200)
IBM06.FNT ;6x6 PC font
IBM11.FNT ;8x8 PC font
IBM12.FNT ;8x16 PC font
------------------------------------------------------------------------------
```

A lot of ASSIGN.SYS files that you will find are set up for a floppy disk,
ie, PATH = A:\GEMSYS\

NOTE: GEMSYS folder is were all the GDOS system Drivers and Fonts are
stored, you can give it any name you like, Atari uses GDOS.SYS as a folder
name, but that name must be showen as the PATH in the ASSIGN.SYS file...

On the net, (FTP Sites) there is plenty of Info regarding GDOS and many many
utils to Automate the ASSIGN.SYS file set up, and to edit it....

Hope this is of help...

```

Check that it is STE... otherwise, you'll need to do some soldering for an
upgrade. Check the TOS type... otherwise, it is basically a 1040 with
a detatchable keyboard.

Thanks for the vote of confidence, Gordie.

As a sidenote, moreso to Dan (and others) rather than to you, it's
easy to make a generalization that members of a group, in this
instance STReport, all think alike because they all are part of
that group. However, it is unfair and usually wrong that the
individuals within that group feel the same way about all things.
I feel perfectly fine that I _share_ some of Ralph's views in a
number of things. I respect the man for having the ability for
"sayin' it like it is" although I don't always agree with how he's
said it. I also don't agree with everything that he's had to say over
the years and will be one of the first to tell him so. But this is
really a lot of water over the bridge. STReport has changed, for
better or worse, with time. We can debate the past and nothing
will change any of it. The present is quite different. Don Thomas
and others at Atari have been gracious and willing to work with me
for close to a year now. I'm proud of the relationship that's
grown over this time. I'll be the first to tell our readers what's
happening, good or bad; and I'll be fair and honest - something I've
always tried to do in the past.

Source record: 181745

You know, most of the atari archives out there have mostly the same files. ftp.uni-kl.de, ftp.cnam.fr, ftp.tu-clausthal.de, etc, etc are, for the most part mirrors of atari.archive.umich.edu. This is quite a bit of wasted space on the net, don't you think?

Why not dedicate certain sites for the collection of say, old source code for renovation, or old START disks or STF or whatever. The archive system is very satisfactory... I can go back and download old files, etc whenever I wish. But is it truly necessary to have 12 or 15 copies of the same file all over the net?

We certainly could save a great deal of space as well as net usage (we all know how busy a.a.u.e can be).

GM> community (computer and game). If Atari is willing to give
GM> STReport a second chance, albeit a carefully watched one,

I'm glad to hear that Dana is making efforts to correct some of the ill feeling between ST Report and Atari Corporation that has taken place over the last couple of years. It's a good start (and more power to him to it).

However, it is my opinion (and a lot of other Atarians in these parts) that as long as Ralph Mariano is editor of ST Report, that it will still be viewed with suspicion regarding journalistic integrity and accuracy. The article earlier this year regarding whether or not DMC Software still supported Calamus or had the rights to it certainly proved that Ralph hasn't changed regarding his particular form of yellow journalism, or towards those who he feels have wronged him.

I wish Dana well in his endevours - it's a shame that Ralph has to constantly sabotage any attempt to bring new respectability to ST Report with his putting his foot in his mouth.

... I get into enough trouble without a tagline!

All of those suggestions sound great - except for the fact that Atari isn't in such hot shape right now and 99% of its eggs are in the Jag basket.

Even if Atari weathers the storm and is profitable again, you probably won't see another Atari computer, instead you'll see an IBM PS1 with a Jag chipset for awesome AV capabilites.

TOS is an endangered OS...it's a shame!

The MEGA ST is way older than your STE, but they are in some ways a better system, you can fit graphics cards, also used to drive the Monoterm monitor, they only use drams, not sipps, and they don't have the same sound and graphic features that the STE has..

The Mega ST was Ataries Pro version of a STF, what you need is a MEGA STE..

Yes, I stil couldn't get hold of one. Geneva is not distributed in Germany
yet AFAIK.

>It would be nice though to be able to get to some of the extra Speedo
>characters from the keyboard, like curly quotes, em and en dashes, and
>so on.

I just did that using Atari's CHARMAP.PRG or the similar X4U (available
from us, DM 25,- + P&P) to edit Speedo's mapping and CKBD to put the keys
on the keyboard. The latter part is currently for German keyboards only.
Keyboard maps are still tricky to edit since there is no graphical
editor available, though I hear someone is working on that in Germany.

For a commercial solution, Harlekin has a graphical keymap editor.

>>6. The icing on the cake - how about being able to redefine all key

If you are familar with a RCS you can also simply change them in the
menu for the moment. Of course you'll have to do it again next update.

mike@divsun.unige.ch (Mike Morris) wrote:

> Table functions work well, once you get the hang of 'em. But I cannot
> work out how to align figures to a decimal tab. I managed it once, but how?

A bit tricky. Put a decimal tab in the ruler, make sure it's dot or comma,
whatever you prefer. Make sure it's left justified. Type in "[tab]" as
"insert before" string in the number format dialog.

> 1. MACROS - MACROS - MACROS ! Please, I need to be able to set up macros
> quickly and easily; for both phrases and single characters (eg "Send copy
> for information to:", or typing "mu" at the current point size...).

A phrase function will soon be added, though this is actually not
much different from "Insert file" in combination with an
autolocating file selector like Selectric. If an ASCII text is
inserted, the text style will come from the cursor position.

For dialog macros etc. separate PD macro recorders can be used.

> 3. It's nice to be able to save styles to function keys: but could these
> _toggle_ like the predefined ones?

That is a complete text style with font, size etc. How could this toggle?
We currently discuss redesigning text style handling, though. It will
probably become document specific and additionally go into a popup like
paragraph formats.

> 4. Better short cuts for moving and deleting (Redacteur is fabulous for
> these): delete/select word L/R, line, sentence, para.

Some of these will change once the gem-list standard currently under discussion
will be decided.
What's wrong with Alt-C, Alt-W, Alt-S, Alt-A, Alt-Y for selecting characters,
words, sentences, paragraphs and pages ? (better look them up in the manual,
since some are language specific)

> 7. (As has been mentioned before here): french dico. please!

We're currently negotiating about that.

It's still partly under construction. Contact Wilfried_Behne@maush.han.de
for technical information.

BTW I just heard NVDI 3 will interface with older GDOS drivers, so a
Postscript driver might work anyway if anyone makes one.

You try to change the stack-error vector, which is a vector used by the debugger (for catching errors). Don' catch it.

>>
>>For dialog macros etc. separate PD macro recorders can be used.

The Harlekin one works well for phrases; but I still do not know how to
get e.g. alpha, beta, or mu AT THE CURRENT POINT SIZE. If the letter
happens to exist in the current font, can be done with Harlekin and
ALT-keypad codes, but this is limited.

>>> 3. It's nice to be able to save styles to function keys: but could these
>>> _toggle_ like the predefined ones?
>>
>>That is a complete text style with font, size etc. How could this toggle?
>>We currently discuss redesigning text style handling, though. It will
>>probably become document specific and additionally go into a popup like
>>paragraph formats.

I would like to be able to switch font like I can switch style (ie go to
Symbol as easily as going to Bold).

>>> 4. Better short cuts for moving and deleting (Redacteur is fabulous for
>>> these): delete/select word L/R, line, sentence, para.
>>
>>Some of these will change once the gem-list standard currently under discussion
>>will be decided.
>>What's wrong with Alt-C, Alt-W, Alt-S, Alt-A, Alt-Y for selecting characters,
>>words, sentences, paragraphs and pages ?

It is just a bit slower: the quickest system I have ever found is the
Redacteur one (Ctrl=word, Alt=sentence, Shift=line; combined with arrows
to move (L & R) or with DEL or B/S for deleting R & L). But I agree that
this is partly personal.

>>> 7. (As has been mentioned before here): french dico. please!
>>
>>We're currently negotiating about that.
>>
Great! You realise that when it comes out I'll ask for a thesaurus
and a conjugation aid ;) ?

Does anyone know if any ftp sites have collections of peronalised
word lists? I've never seen one. I would happily contribute Genetics
lists for Redacteur and Papyrus (I'll bet there's a lot of demand

for them!)

Ouch! Why, when you can go over to Sweden and buy them for only 7500SEK (~6000DKR, 1500DM, $1000USD, £650GBP) ? And we have the same tax rate (25%) as Denmark so you will loose little or nothing.

Mike Morris wrote using postfix electrons on 17 Aug 94 (to All)...
> I would like to put a bigger, faster HD into Stacy than her
> original 40 Mb Conner. Has anybody upgraded themselves? What are
> the pitfalls? (If it is solder-free I can cope, otherwise no way!)

As was noted by a previous reply, the two required characteristics of the new drive are 1) physical size (low profile 3.5"), and 2) that the parity check option must be able to be disabled (since the internal SCSI-card does not handle parity). PLEASE NOTE: not all drives will allow parity-check-disable EVEN THOUGH THEIR DOCUMENTATION SAYS SO. Later production runs have omitted this option, and even the manufacturer's technical support won't always give you correct info on the first try! Some drives (Quantum) have software disable only, which won't be very helpful unless you can set this on another (parity) system first before installing the drive.

A warning: when I changed my 40M to a Maxtor 245, I had to turn the SCSI cable end-to-end in order to be able to connect it properly, since pin 1 on the drive was oriented in the opposite sense compared to the Conner. Just turning the connector didn't work because the 2 x 90 bends wouldn't come out with enough slack, but reversing the cable made it work, just. A bit of extra work was required to cut and file off the cable connector key so that it would fit in the Maxtor socket.

Final note: most drives are not as fast in spin-up as the original Conners. This may give you some confusion in that your drive may not come up properly when you turn on the Stacy. Depending on the drive you may have to get the habit of hitting reset, leaving the boot disk out of the drive a short while, or some other method of delaying the HD-access attempt just a tad. I've heard this is a fairly common problem with Stacy 1/20 since their memory test is completed much faster and even the Conners aren't always ready then. Some drives may even lock-up on the first power-on attempt requiring a power-off, wait and power-on.

That said, a Stacy 4/245 is a distinct improvement over the 4/40.

2727. Software for sale or trade

Newsgroup: comp.sys.atari.st
Date: 1994-08-23 22:13:52 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <33dsb0$54i@mailer.fsu.edu>
Source record: 181603
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For sale or trade:

Well, time to clean out the software shelf! Below are a bunch of items I want to sell or trade. For buyers, highest reasonable offer gets the item, with preference going to those that buy more than one item. Shipping will be negotiated with the offer.

As for trades, let me know what you have and we may be able to work something out. I am looking for some games (Vroom, Chaos Engine, Armorgeddon, Prince of Persia, and many others), Stereotek 3D glasses, working Wico bat handle or Ergo joysticks, European ST magazines (ST Action and ST Review particularly) and probably lots of other stuff. Cash can make up for deficient trade material from either party. Shipping will be negotiated with the trade (though for trades, I often suggest that both parties eat the shipping). Don't be shy, send me some email and let me know what you have to trade.

All of the items below are original commercial products owned by me. Unless otherwise noted, all original boxes, manuals, and disks are included. I have cheats for some of the games, and will include them with the sale/trade.

Please reply via email.

****Application and Utility****

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch either. Blazingly fast (hence its name), even on a box-stock 8mHz system. Designed for programming, great for general editing as well.

Neodesk Command Line Interpreter, v. 2.0, adds a command line interface to Neodesk with MSDOS/UNIX style commands. More commands can easily be added (the GNU versions of standard UNIX utilities, for example). This version is really more MSDOS-like than UNIX-like, but the new version 2.1 (to which this can be upgraded) is supposed to be more UNIX-like. There are a couple of neat things about this CLI. First, it pops up in a window on the desktop, so a CLI is only a mouse click (or keyboard macro) away. One can drop batch files onto the CLI icon to execute them, which can be quite handy. Finally, it is quite small, primarily because it reuses the routines in Neodesk to do standard file operations (i.e. when the CLI copies a file, it uses the code already in Neodesk to do it). Only works with Neodesk.

Wordup v3.x, Neocept, with the large thesaurus and large dictionary extra options, plus lots of Genie notes about bug fixes and work-arounds. This is an excellent WYSIWYG word processor, but it does have some bugs. The rights to the code were purchased by Atari (and some of the code used in Atari Works, or so I hear). It is not buggy enough

to be unusable, just irritating at times. This is the final version
that was released.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet printers,
includes a bunch of 150 and 300dpi fonts. Claims to be 200-500%
faster than other HP drivers (for that time, I don't know if there
are faster ones out now).

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft
product ever made for the Atari that I know of, includes a full
copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez,
did I really do that? I must have been really patient back then :-).
I managed to produce a bunch of papers and letters with it using only
a floppy and color monitor, so it is somewhat useful.

Personal Pascal, ICD, I believe this is the final version of this compiler.
The only limitation with it that I know about is that one cannot
pass functions as arguments. Other than that, it is a complete
Pascal compiler environment. The lack of this feature will not
hamper most Pascal programmers, IMHO. Good docs on both Pascal and
the Atari programming environment (it's a big fat softcover book).

Home Accountant, Haba systems, personal financial management software. One
can manage budgets, bank accounts, credit cards, print checks, etc.
It can also generate a tax summary and other budget things.

Time Link, Batteries Included. Excellent personal scheduling software.
Has a few bugs, greatly useful stuff. Can search/sort database
of entries, shows one's schedule by the week, month, year, etc.
Very easy to use, well-designed GEM user interface.

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES (Arcade Action)****

Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two
simultaneous players. Plenty of fast and furious shooting.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II
in space, best with two simultaneous players (screen is split to give
each player their own view). Overhead view, destruction galore.

Ballistix, Psygnosis, Bizzare soccer style game, where one shoots at the
ball to move it around. Really great graphics, so-so gameplay.

Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action).
Future setting, sideways scrolling, large sprites, good guns. This
is a pretty hard game, but lots of fun.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross
country motorcycle racing game, Crazy Cars is a racing game. Both

are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Custodian, futuristic platform shoot'em up game, excellent graphics, fast scrolling, lots of weapons, etc.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small child (in terms of its difficulty). A bit boring for us big children, IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics are quite lame (mostly text, in fact), but I suppose a political process fan might like it. It does not appear to be particularly tied to the 1988 elections, and has data for US elections all the way back to 1960. Can apparently be used to predict elections as well.

****Adventures (Graphical Adventures, most with some arcade action)****

Temple of Apshai Trilogy (includes Temple of Apshai, Upper Reaches of Apshai, Curse of Ra), Epyx, full docs, classic blast from the past, nicely done. These are overhead view graphical role playing games (RPG).

Ultima III, Origin, with all docs, cloth map, box. Classic RPG adventure, by Lord British.

Questron II, SSI, RPG, very similar in look/feel to Ultima IV, in terms of graphics and gameplay. Medievil setting.

Bard's Tale, Electronic Arts, yet another RPG, very good. Graphically impressive for its time. Search through buildings, dungeons, and towns (Skara Brae) in 1st person 3-D graphics (small graphics window and restricted movement, but this was many years before anything like Doom was ever seen :-).

Mercenary: Escape from Targ and Second City, early 1st person 3D vector graphics adventures. Future setting.

Gold of the Realm, Magnetic Images, very similar in look/feel to Ultima III, in terms of graphics and gameplay. Medievil setting.

Breach, Omnitrend, classic RPG game, GEM interface mostly, future setting, control a bunch of Marines as they search and shoot stuff.

>Jim Baumgardner (jbaumgar@bronze.coil.com)
>"Would you _please_ stop clicking my head?"

Well we should have at least one mirror site, the other Big problem
is very little Standards, the European Sites have very good Mail Servers,
A.A does not...

The other problem is the directories on all sites, No standards, Hansa
being one of the worsed to use, come on chap lets have some nice Director
standards, and full commented Indexes for those Directories...

Gopher servers that don't work, there Tables are only set up for MSDOS file
exstenders, you can' get those .TOS files ,etc....

One German site stated that they were going to fix there Gopher server,
but after 6 weeks, its still not fixed, I contacted a few Gopher servers
about 4/5, so far only one fixed up there server problems, and that was
tu-berlin, good on you...

What we need is good standard, not this willy nilly way thing are done now...

Does Migraph still exist? I have just picked up one of their hand scanners complete with Touchup and would like to update Touchup to the latest version.

Also, can I use the scanner interface (cartridge) with any scanners other than the one that comes with the interface. I am hoping to connect a colour or at least a grey scale scanner.

Thanks,

Dave.

I found TurboGIF v1.2 (94-07-18), by Sascha Springer, on a BBS a few days
ago. I suppose that's the program you're talking about.

>It runs on the Falcon only, no matter what color mode you'r in. (it'll change

It screws up the screen totally on my Falcon with BlowUP030 Hard II.

>by itself), and it's the fastest i have ever seen.

Yes, the decoder is actually a bit faster than my latest version of MGIF,
but the drawing is slower. It'll be interesting to see which program is
faster when I've removed the last memory variables in my code.

>I can only recommend it, cause it's also freeware.

So is MGIF. ;-)

>Ups. Forgot to mention, it also has somekind of hardware scrolling. Sure

MGIF 4.4 has no internal support for scrolling right now, but the hardware
scrolling used by BlowUP030 works fine with it.

>ething !, and it was quite good then. Perhaps I have missed out on a particu
>larly bad patch !

Back when it was ST Amiga Format, it was quite good. This must have been
in the late 80s. Around 90/91 it was pretty poor IMO. I dropped it for
about 6 months, but continued to get STU. I still looked at STF on the
shelf, and after a bit - decided it was *better* than STU was, so I started
buying it again.

> to them. After reading it, I now wish to say that my original statement, wh
>ich I apologised for as being a bit 'OTT', was in fact, not OTT enough.

The main problem IMO is the inaccracies. STF cannot be taken seriously
because you cannot trust the info in it. As for something interesting to
read - I find it worth buying.

>The only mitigating point is that I accept that STF *is* aimed at teenageers,
> and, at 30, I may not be appreciating the 'teen appeal' aspect of it's conte

Yep, and I'm 25, and its a bit juvenile for me also. OTOH back in the truly
early days they paid me 30ukp for a single letter, so I've always had a
bit of a soft spot for it ;-)

> production & R&D of all machines, bar the Jag. So folks, the ST, TT & Falc
>on are all on their way down the Swanee together. I'm not happy, particularl

But does it really matter?:

1) Atari have done so little for us in the last 2 years, I'm sure we can
all manage the next 2 without their help.
2) In 2 years time, I will have owned an ST for 10 years, and I think I'll
treat myself to some horrendusly powerful RISC workstation! ;-)

:-)

I am currently using Gemulator; therefore, I only know
the Gemulator. Gemulator can accept 4 different TOS (2 bios each).
That means that you can power up a different TOS each time
if you have 4 different TOS in the Gemulator.

Gemulator came with the latest TOS (2.01 I think, but sure on
the version number).

You can run under windows, DOS, OS/2. It uses DPMI (I think).
You can have 2M-8M of memory. Their latest software is version
3.1. You can have virtual HD. This means that it writes your
atari files in 1 one big file which Gemulator understand. It acts
like a hard disk to the Gemulator.

It is very good. It does its job. I think Toad Computer is selling
it for $200. Prices might be lower now.

2744. FAQ: GDOS 2.1 (German)

Newsgroup: comp.sys.atari.st
Date: 1994-08-24 08:22:05 UTC
From: CASTAN@cip.physik.uni-stuttgart.de
Message-ID: <33evvd$dj3@info2.rus.uni-stuttgart.de>
Source record: 181678

Hello,

the English version of the GDOS FAQ 2.1 will probably come soon.
"soon" is (TM) Atari.

This is the German version:

Hallo,

ich habe gerade das GDOS-FAQ, Version 2.1 in de.comp.sys.st und
maus.gui.gem gepostet.
In dieser Gruppe kommt nur dieser Hinweis um Bandbreite zu sparen.

de.comp.sys.st: ein File als TeX-Version und eines als ascii-Version
maus.gui.gem : ascii-Version, wegen der 16K-Grenze gesplittet
comp.sys.atari.st: englische Version 2.1 als ascii-File (demnaechst)

Name in Fileservern und Mailboxen: gdosi21 bzw. gdosinf21

TeX+ascii-Version werden von Uwe Seidler in den Programmteil der Maus
@S3 gelegt. In der Maus @B sollten sie schon liegen.
Ebenso in ftp.cs.tu-berlin.de:pub/atari/Gdos/gdosi21*

Aus dem Inhalt:
- alle mir bekannten Drucker- und Bildschirmtreiber mit Bezugsquellen
- alle mir bekannten Programme, die ueber GDOS ausdrucken (ueber 40)
- Hilfsprogramme zum Arbeiten mit GDOS
- Tips und Tricks
- Adressen, bei denen man die genannten Produkte bekommt
- kommentiertes Literaturverzeichnis
- und vieles mehr

Neu an der Version 2.1:

Neue Kapitel/Infos sind mit + gekennzeichnet, ge"anderte mit *.

+ Programme DPE, MIDI File Printer, TRIPLE_D, GRAPH, 7Up
+ Programme UpToCase, Chemograph Plus, GEM-View, Solutions
+ "Uberschriebene Speedo-Schnitte
* PAINTJET Farben
* BasiChart
+ X4U
+ SpeedoGDOS 5.0a/b/c + Treiber
+ Fonts
+ Verschiedene GDOS-Versionen

Viel Vergnuegen damit.

MfG,
Gerd

: The other problem is the directories on all sites, No standards, Hansa
: being one of the worsed to use, come on chap lets have some nice Director
: standards, and full commented Indexes for those Directories...

Sorry to be picky...but you mean Hensa...and not hansa.

Oh, and BTW, it was not my idea to have these directory structures at hensa. This started a long time before I got here. I got here in April...the site having been going since 1987.

If you want a full explanation of why the directory structure is as such, then do contact me privately...or refer to some other article in this newsgroup.

The directories, OK, are not very nice to come across, but then, that is only for ftp sessions. What most people do in ftp sessions is to find a file via archie (hensa is now included), and then go to that path directly to get the file. Or a lot of people download an index, and find the path through that.

Hensa, IMHO, is one of the best places to go for software, if you use gopher, or WWW. Try it, and see.

Also, the index files are fully commented. Each of the different packages, contain a .MSG file, which describes the package, so you can see whether it is worth downloading.

The files are sorted via keywords...such as Programming languages....text editors....Software development tools...archiving programs. The files in a particular microcomputer section can then be searched via keywords...(gopher/telnet/WWW)

: Gopher servers that don't work, there Tables are only set up for MSDOS file
: exstenders, you can' get those .TOS files ,etc....

This was the first thing that I tried to fix, when I got to hensa. The fault is not with the tables, as this was put in near enough straight away, as were others, such as gz, tgz, tar, msa, etc. The fault is within gopher itself... a few bits of extra code may have to be put in somewhere...something which we are looking into...and it's not easy, as there are other things of priority, seeing as we have just installed a new machine, and finding things going wrong. But the TOS extender problem is certainly on the list.

What happens, is that even though TOS is placed in the tables, gopher does not recognise it...and when looking into it...the filename displayed does not include the extender...even when the file is specified as an .EXE PC file, or a PC Bin file.

: What we need is good standard, not this willy nilly way thing are done now...

OK...but then, say if Atari Works was a PD program....what section would it go under? Word Processing...Spreadsheets...databases...other...Misc?

A lot of programs fall under different categories...and so this way, the hensa keyword system works. There are 3 types of index available at hensa...a normal one which lists the package code and the name of the program and a short description. Also, there is a keyworded index...and a comma delimited index...which you may load into your database or spreadsheet, and browse/search via there. There is also a ls-lr.Z file...listing the filenames, and their paths only.

You takes your pick.

James E. Baumgardner II (jbaumgar@bronze.coil.com) wrote:

: Two words: linked filesystem

Two reasons....

1 - Increased load on one system....something that is not desired by
the moderators/maintainers...machine crashing, etc. NFS is quite buggy
in that way. What is desired is a lot of people logging in, but then we
do not desire a massive load. This also slows the system down.

2 - Security loopholes on the host system. The host will make publicly
available their filesystem.....and it is based on trus between
hosts...but then due to security loopholes...any Tom, Dick and Harry
can walk all over the system.

If it came with AtariWorks, it SHOULD also have SpeedoGDOS. If
you don't have AtariWorks, then there's no reason to expect
SpeedoGDOS to be included. If you have AW w/o SpeedoGDOS, then
whoever you bought it from may have either kept it or forgotten
to give it to you. Having bought it used, though, Atari is under
no obligation to give you a copy.

Falcons in the UK did not come supplied with Atari Works, but those with a
hard disk did have SGDOS. If the bloke who had this computer before me
simply didn't claim it, would that change anything?

Remember, not everyone is American :-)

2754. Papyrus and colour?

Newsgroup: comp.sys.atari.st
Date: 1994-08-24 11:52:29 UTC
From: mike@divsun.unige.ch
Message-ID: <1994Aug24.115229.7387@news.unige.ch>
Source record: 181691

I want to print from Papyrus to my HP1200C inkjet (a bit like a 550C, with separate CYMK cartridges, but better...). The 550C driver prints the black fine, but nothing for colour bits. The 500C driver, which is written for only 3 colour cartridges, prints everything fine : but not in the expected colours.
How do I get a correlation between the text in the colour dialogue (ie the colour names), the on-screen colour, and the printed colour? (I do not want a Focoltone-style correlation: I just want blue blue, red red, and you can guess the rest).

I mentioned in an earlier post that the Harlekin macro function was great for text macros in Papyrus. But I have now realised of course that you have to switch the damn thing off when you use other programs (including the desktop!).

>tries to load the sound

With the correct Backwards settings (I don't remember which), I got Epic
to run correctly through the whole introduction. The 3D graphics worked
perfectly, but I think the sound was a bit too fast. I was allowed to type
in call sign and level password too, but the game then stopped directly after
the first screen update from inside the cockpit.

I don't think the problem could be very difficult to fix, given that so
much works, but I don't have the time to do it right now.
Usually the compatibility problems are very localized, like in Civilization
and Microprose Golf, so it should not be too much work, I think.

I suggested here a couple of months ago that the pirate groups should try
to redeem themselves by doing these kinds of fixes. I've not heard anything
about that since. Perhaps none of them have access to the net or maybe they
are just not good enough to do it. ;-)

2757. MIDI thru code

Newsgroup: comp.sys.atari.st
Date: 1994-08-24 12:20:10 UTC
From: bouronm@trout.ime.dec.com
Message-ID: <1994Aug24.122010.9730@peavax.mlo.dec.com>
Source record: 181695

```
Hi People,

A while back, Ted Lyngmo asked that I post a snippet of code that I sent
him which echoes MIDI in to MIDI thru. Here it is:

---- cut here ----
*
* through.s -- MIDI input handler routine to simulate MIDI thru
*

csect text,code
xdef _install_thru,_uninstall_thru ; export entry points
xref _thru_channel ; reference external value

midisend equ $fffffc06 ; MIDI output register
midiread equ $fffffc06 ; MIDI input register
midictrl equ $fffffc04 ; ACIA control register
midistat equ $fffffc04 ; ACIA status register
mfpiis equ $fffffa11 ; MFP
bit6 equ $40 ; ..MIDI ACIA bit
notbit6 equ $bf

_install_thru:
move.w #$0022,-(a7) ; push Kbdvbase function code
trap #14 ; Xbios
addq.l #2,a7 ; tidy stack after Xbios
movea.l d0,a0 ; copy address of Kbdvbase table
move.l (a0),oldvec ; save first entry (midivec)
move.l #interrupt,(a0) ; install our routine
rts ; return

_uninstall_thru:
move.w #$0022,-(a7) ; Kbdvbase
trap #14 ; Xbios
addq.l #2,a7 ; tidy
movea.l d0,a0 ; copy table pointer
move.l oldvec,(a0) ; restore old value
rts ; return

interrupt:
btst #3,midistat ; check MIDI output status
bne.b notready
cmp.b #$ef,d0 ; system byte?
bhi notready ; don't forward system messages
tst.b d0 ; status byte?
bpl send ; don't touch data byte
```

```
andi.b #$f0,d0 ; zero channel
or.b _thru_channel,d0 ; set to global "thru_channel"
send:
move.b d0,midisend ; echo MIDI IN to MIDI OUT
notready:
andi.b #notbit6,mfpiis ; disable interrupt-in-service bit
rts ; return

csect storage,bss
oldvec:
ds.l 1 ; old midivec place saver

end
```

*** through.s ***
---- cut here ----

To use, assemble this code, then link it into your C application. Set the global variable "thru_channel" to be the MIDI channel for the resulting output stream (this bit of code can be hacked to make the thru stream verbatim, rather than channel-shifted). Now you can call "install_thru" and "uninstall_thru".

I hope someone finds it useful. BTW, I originally got this from someone else: alas, I don't remember who. If anyone recognises their code, please feel suitably pleased with yourself. :-)

Cheers,

Message-ID: <33fgpu$q4d@cc_sysk.coventry.ac.uk>
Source record: 181698

I've asked this on the Mac newsgroups; they had no idea, but told me to come here. So...

In order to store some large sound samples, I'd like to use my Mac PowerBook 180c as a SCSI hard drive for my Atari ST. The PowerBook has a mode whereby it can be used as a SCSI drive, and the manual gives instructions to connect it to another Mac for this purpose. It doesn't mention connecting it to anything else. I understand that you can get interfaces for the Atari ST that let it use SCSI hard drives - so, does anyone know if this set-up would work?

2762. Huge Atari ST lot for sale

Newsgroup: comp.sys.atari.st
Date: 1994-08-24 13:36:21 UTC
From: jrl8@namaste.cc.columbia.edu
Message-ID: <33ficl$knh@apakabar.cc.columbia.edu>
Source record: 181606
Cross-posted to: comp.sys.atari.st,ny.forsale,nj.forsale,misc.forsale,misc.forsale.computers.other

Total price reduced from $895 to $795 for the entire list below.
What follows is the context of the original post. If you have any
questions let me know. All of this equipment is privately owned
by me, not JBJ of New York, Inc.

I have the following Atari ST equipment for sale. I would like
to sell everything together, but would consider serious offers
to break up the systems.

Atari 1040ST computer system w/mouse (TOS in ROM)
(includes built-in 3.5" drive) --- loose power cord but works great
Atari 520ST computer system w/mouse (TOS in ROM), works sometimes

2 Atari SC1224 color monitors
Atari SF314 double sided 3.5" disk drive
Atari SF354 single sided 3.5" disk drive

Supra 30 megabyte fast hard disk with NeoDesk operating system

All power cables, power supplies, and cables are included to
hook up everything.

The following software, all with original disks, boxes, and manuals:
Word Writer 2.0 Timeworks (barely used)
Timeworks Desktop publishing Timeworks (with bound manuals, never used)
Crazy Cars Titus
International Soccer Microdeal
Wizards Crown SSI
Questron II SSI
Heroes of the Lance SSI
SDI Cinemaware Interactive Movie
TetraQuest Microdeal
Prime Time First Row Software
Starglider Rainbird
Starglider II Rainbird
F15 Strike Eagle Microprose
Rings of Zilfin SSI
Speed Buggy Data East
Typhoon Thompson Broderbund
Guild of Thieves Rainbird
Outrun Sega
Captain Blood Mindscape, Inc.
Road Runner Mindscape, Inc.

Road Wars Electronic Arts
Obliterator Psygnosis
Sinbad Cinemaware Interactive Movie
Defender of the Crown Cinemaware Interactive Movie
Pinball Wizard Accolade
Bubble Ghost Accolade
Ultima IV Origin Systems (+ cluebook)
Dungeon Master FTL (no box)
Virus Rainbird (no docs)
Moebius Origin Systems (doesn't work)

The following software has original disks and manuals but no boxes:
Aegis Animator/ST Aegis
Impossible Mission 2 Epyx
ST Basic Atari
Flash Antic Software
Block Out California Dreams
SimCity Maxis
High Roller Mindscape
Time Bandit Michtron
Barbarian Psygnosis
Airball MicroDeal
Airball Construction Set MicroDeal
Skyfox EA
Neochrome Painting Program Atari
UMS Rainbird
ST Wars Miles Computing
Chaos Strikes Back FTL
Swiftar Accustar Software, Inc.

Plus dozens of other games (Rogue, Test Drive, Sundog, etc.) with
just original disks (no box or manuals), plus a TON of shareware
on disks, plus old Atari distribution disks (DB master one, megaroids,
languages, etc), plus an entire collection of START disks representing
about twenty issues.

There are also duplicates of some of the software (Dungeon
Master, Time Bandit, etc).

I am looking for $895 for the entire lot.

Please call or email if interested!

Best regards,
-JRL

>on a FLOPPY, they start from sector 1...!!!!!

PHYSICAL sectors (i. e. sectors as the floppy controller sees them) always
start with 1 on each track, never with 0.
LOGICAL sectors (i. e. sectors as TOS sees them) on floppy disks always
start with sector 0 (this is the boot sector).

Why not ?
I think that in this mode the powerbook is "shut-down" in order to let disk
being accessed from another master BUT (there is always a but) partitions
on hard-disks are not the same on a Mac and on a ST, so I guess this will not
work unless you have a ST partition on the Mac. Am I correct ?

Christian, it would be very useful if the paragraph formats couldn't only be chosen with the mouse in the popup menu, but also with a keyboard short cut - especially if you type at the bottom the window and quickly want to change the current format.

Well, if it is able to act as a second drive to other Macs, or even as
an external drive to a Mac, then you should be able to use it on your
ST. You will need somethink like the Link, or even better, a LINK 2.
With the link, you have to ensure that parity on the drive is
disabled.....this is not necessarty with the Link 2. The Link 2 costs
around 90 pounds.

Anyone think I'm wrong? If so, please correct me.

Danny.

I'm not sure what 'enscript' is, but I guess it may be something like IdeaList. Idealist drives lots of printers, and should be available on atari.archive .

Source record: 181610

Several people have asked me about the compressing multi-session terminal program Terminus. I regret to tell that what I said about portability is far too true:

- Mono mode is hard-coded
- 2400 bps is hard-coded, since it's all I've got. Though it is easy to change, the compression at least might lag with faster modems, unless I recode it in assembler.

I'd happily give away the source, but:

- Everything is in Swedish (comments etc)
- I use the incredibly ancient Megamax 1.0 pessimizing compiler with in-line asm at places, again since it's all I have. Cavemen probably had better tools when developing fire.

The most portable thing in the mess is probably the Unix-based multiplexer, which is written in ANSI C, compiles under SunOS and should be easy to port (if you understand Swedish, at least).

Anyway, if anyone still wants the source or binaries - perhaps to see how it works in order to write a better thing - drop me a mail. It still has its strengths, such an almost well-performing compression scheme, and a reasonably fast vt102 emulation with Latin-1 char set, scrollback buffer and some extra escape codes added. It's also small (<30k).

Humblest apologies for raised expectations,
o
Mattias Engdegard.

I just found out that Medieval Chess is in the Sept. Issue of STF's
cover disk.

It is a one or two player game, with chess rules. However, once you
'claim' a piece, you must go into battle in order to win/lose it. Its
much fun with digitized sounds, and good graphics. It works on the
Falcon too, as long as you are in Low rez.

Flight Simulator II is probably the most technically accurate flight sim
available for the ST (for small unarmed aircraft, at least :-). I am not
sure about all the specs you list above, but perhaps you could find out
from a software dealer. FSII was/is a pretty popular program, and there are
numerous data disks for it (even an adventure game of sorts, where one flys
over "clues" to the next destination - this is on the Hawaii data disk I
believe). Hope that helps.

Message-ID: <33g4hq$hrd@msuinfo.cl.msu.edu>
Source record: 181616

Well, time to clear out the closet...

I have a 1040STfm, includes
TOS 1.02
1 Mb RAM
internal DSDD floppy
modem cable
several disks of utilities
original manuals

It's in excellent condition. I've never had any problems with this machine, and I'm the original owner. Used it mainly for word processing, telecommunications, and programming.

I'm asking $120 plus shipping. Price is somewhat negotiable (best offer over $100, or the first $120, gets it).

For another $20 I'll throw in WordUp from Neocept. Works great on this machine and provides you with multiple fonts, columns, graphic import, etc. Includes original box and docs (they're one and the same, actually).

Make me an offer via email. Please don't post offers to newsgroups.

Tom

From: bobbro@delphi.com
Message-ID: <p29TNdf.bobbro@delphi.com>
Source record: 181612

Hi Mike,

When you boot your Stacy, hold down the control, shift and alternate keys. That will signal the Stacy to bypass the HD. Get a different version of AHDI and boot with it off of a floppy, and then install drive C from under the OPTIONS menu. Delete the SHDRIVER.SYS file that AHDI 5.04 installed on your system, then run HINSTALL.PRG of something other than 5.04

All of the versions of AHDI 5.x were designed to have IDE support. You should be fine with just about any other version of AHDI, unless you have and ICD AdSpeed installed. Then be sure to stick to 4.x or less.

Hope that gets you going again.

Hi David,

If you purchased a Falcon second hand, your primary recourse should be to contact the seller and ask for the diskette. Atari UK's policy might be different than Atari US's, but as a rule there is no warranty for second hand gear.

On a different note, the version of SpeedoGDOS that Atari is shipping with the Falcon is not as current as the one that COMPO is now selling. I recommend that you contact them for the latest version. It's a major improvement over 4.x

regards,

Bob Brodie

Patrik,

Steve has given you a better picture of why I left Atari. I was approached by a friend that started a company doing NEXTSTEP software with an opportunity to work for them at a handsome increase in pay AND the ability to work at home. The combination was such that I could not in good conscience to my family decline the offer.

I enjoyed my time at Atari tremendously, and still use Atari products. I count many good friends among their employees, and wish the company every success in their future endevors.

You're right, I am very fond of the Falcon (although I'm typing this on a TT030 at the moment!) and prefer the computer business to video games. But that wasn't much of a factor in my decision to leave Atari. My children are growing up fast, and I don't have too many years left with them at home. If I am to be the kind of Dad that I want to be, I need to be home more. That would have been very difficult to do at Atari.

regards,

Bob Brodie

I don't know what Archon is like. STF's review said it is an chess game with some altered rules (you have to fight for each piece, wether you moved or your opponent moved, so you can loose a piece if it's your turn or not...)

I'd avoid maxidisk altogether; it's not reliable, and it's slow. Version
1.5 worked OK with TOS 1.04, but when I upgraded to 2.06, v1.5 caused
file corruptions, and v2.2 locked up the machine if you tried to copy
large files.

My choice for a ramdisk is M-disk, which does everything I want, for free,
except data compression, and works great with TOS 2.06 (Though the fact
that you can only define the ramdisk as drive M is a little annoying.
Is there some historical reason why drive M seems to be a default for
ram disks?).

Yes, with no problems. Try the Eternal 2.1 ramdisk on atari.archive. In
my pre-harddrive days, my "archiver" bootdisk would create a 1mb ramdisk and
automatically copy arcshell, arc.ttp, and lzh.ttp to it. I believe the
auto-copy program I used is called tport, and is also on atari.archive.

Doesn't Sublogic's Flight Simulator II offer instrument flying (and alot more)
to boot?

It's a good program though no longer supported and it won't work on STe's
(though the Falcon works - I think) due to copy protections.

Well if you get a update to there TouchUp software, you will get 128 grey
scale support, this is with version 1.8x of that software..

They also make a colour scanner, but I don't know the price of it....

I know I may get shouted down for this, but I'd sell it off. I tried to
fix up a system to something usable ONCE - OS upgrads, memory upgrades,
disk drive. By the time it's over, you could have bought a 1040 ST
(with a built in DSDD drive), TOS 1.4, and a color monitor. And
had money left over. So maybe you'd want to keep the monitor, but
sell off the 260 and the drive.

```

I reckon! Anyone mention anything _good_ Ralph ever did for the Atari world? In all the ST-Report (Now "Silicon Times Report") issues I read, all I ever saw were negative comments, and a lot of (often extremely petty) remarks. Usually around 20% of each issue was just the exact same pointless ad's and anti-Atari messages as each prior issue. A waste of space!

OK....

You just need:

http://micros.hensa.ac.uk/

and then click on the Atari button...and you will get a link to all the
other pages available...even the ZFC pages...and pretty soon, the Linux
680x0 pages...when I find them...anyone know what address they are at?

There is also lancer's page, which has loads of other things, such as
the unofficial Jaguar pages...loads and loads of info.

And you can click on a file, and it will be downloaded to you...you
have access to the whole of hensa's catalogue.

Hope this helps....comments most welcome.

2806. Formatting/initialising a single HD partition

Newsgroup: comp.sys.atari.st
Date: 1994-08-25 10:18:18 UTC
From: geert@ahold.nl
Message-ID: <4910@ahds.ahold.nl>
Source record: 181502
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi folks,

Currently I am trying to install MiNT one partition of my harddisk.
The partition I use, was originally used for Minix and had a Minix
filesystem on it. This is probably not the same as the minixfs
MiNT uses. With HDX program of ATARI you can zero one partition,
as I did after I failed to install MiNT on the harddisk partition.

HDX doesn't install a new filesystem on the partion I just zeroed.

So, finally, how can you format one partition of your harddisk and
create a new TOS filesystem on it?
Can it possibly be done by not formatting your entire harddisk
(and spending many hours/days to backup my entire harddisk's structure)?

Can anyone out there help me out?

Thanks in advance,

Geert Jonkheer.

I don't know if this the kind of thing that saves paper, but only uses
the built in printer fonts, it call Ildealist 3.5, comes with full
English and German Doc's, and should be found on most sites..

If you are into saving paper with printing lots of Doc files, then Ildealist
is the thing for you...

Comes from memory in 3/4 parts...

2816. Transverting .ZIP files?

Newsgroup: comp.sys.atari.st
Date: 1994-08-25 14:02:36 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <33i89s$t6n@charm.magnus.acs.ohio-state.edu>
Source record: 181555

Well, I've used the Transverter utility many times in the past to convert from a small mfs partition on my drive. generally I have used it to shuffle large (bigger than a floppy-disk) files back and forth between mac and atari. However, for some reason, I cannot find a setting that will properly 'transvert' some .ZIP files made on the mac to the ST. Since they are larger than a floppy (1.2megs compressed!) I either have to transvert them, or transfer them via modem (at 2400 baud I don't want to do this!) ST ZIP does correctly read and decompress smaller .ZIP files which I have transfered vie floppy using Access PC on the Mac side of things...

Anyone know what the heck transverter is doing to screw up these files? I have, of course, chosen to tranvert them as 'mac' files, and then even tried 'text' when the 'mac' option fialed, even though I knew it should not work...

Any hints? Suggestions? Money?

Thanks!

I have a fully working emacs 18.57 running on my Falcon!
It's it dumped on the same machine, and I'm using every day with no problems whatsoever. (Except for the usual slowness of the program, which has nothing to do with bombing)
Are you running MiNT?
Which version?
What other program are resident in your machine?

I'm running MiNT1.11Beta, Unixname and tcsh 6.03 PL3. That's it! No GEM! Oh sorry, Xboot is started before this, but that's it!

>But not in the Atari-World. Come on you main-language-speaker,
>learn a little German. Starting today! Some words per week.

Yeah. And a good way to do that is to *GRAB* that piece of German
software and simply try and understand it. For (1) the usual
key combinations are likely to be used (2) the Atari menu items
are usually ordered the same way and (3) German and English are
not so vastly different that you can't teach yourself enough German
to understand a German GEM application.

BTW, I am not suggesting you should start using Tempus here :-)
If Geschwindigkeit is not your main pro, there are other
Pro's which do speak English and are more capable...

Perhaps it would be marketable to write a small booklet of 'GEM in
German'. Who knows, one of us may find the time to do it...

It would have to be distributed by a US company because of the
difficulty with copyright laws.

Correct!
Only the "Notator Logic Audio" version is limited
to the falcon, due to the hardware difference.

Bye,
F/x.

True type fonts can only be used with speedoGDOS v5. If you have speedo
GDOS v4 you can use bitmap GDOS fonts and Bitstream vector fonts only.

Do you mean by MIDI cable only, or others, too?
There are a couple of games linkable via nullmodem cable which are a lot of fun to play, which come to my mind here:

- Falcon II (You can have real fun dogfights against each other with two F16.)
- Populous
- Powermonger
- FlightSim II (Well, just flying next to each other.)

Well, and then there are a whole series of two player levels in OXYD II (or was it 1?).

Try the HENSA software archive. Under "Atari" it has (apart from the obvious
archive) links to a fair few Atari pages, including ZFC etc. Those should
give you enough links to keep you busy for a while...

Its URL is:http://micros.hensa.ac.uk/

Has to be because of BlowUp then.

>Yes, the decoder is actually a bit faster than my latest version of MGIF,
>but the drawing is slower. It'll be interesting to see which program is
>faster when I've removed the last memory variables in my code.

I didn't knew MGIF worked on the Falcon. I have used it on my STE (in mono)
to be able to view gif files fast.

>So is MGIF. ;-)

Yep. MGIF has done a great job on my STE.

>MGIF 4.4 has no internal support for scrolling right now, but the hardware
>scrolling used by BlowUP030 works fine with it.
>

Sure would like to see when you finish MGIF for the Falcon.
Maybe you can explain why TGIF isn't bigger than 3Kb. Normally when we see
a gif (or whatever) viewer they'r alot bigger than that ?

As you might guess by the subject-line, I'm about to replace my ST-
system with a PC to the lowest cost possible. So, could I perhaps to
continue to use my color monitor SC1224 hooked up to a PC with a decent
graphic card, so that it will be recognized?
Would it eventually be able to handle Windows? (:-)

Just asking, somebody once told me something vaguely like 'CGA'-standard.

Thanks for your input, Elmar

Perhaps one could put commonly encountered German GEM menu items in a text file, and run Ger2eng on it? It should be able to do a great job on single words (but boy, do sentances come out funny :-). Periodically adding to this file should yield a list similar to the booklet you describe.

2831. Assembler help needed: VBI equ $70

Newsgroup: comp.sys.atari.st
Date: 1994-08-25 17:17:52 UTC
From: rrk@vixen.cc.bellcore.com
Message-ID: <33ijo0$38n@athos.cc.bellcore.com>
Source record: 181568
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,

I'm trying to learn assembler using some old ST Format issues,
an Atari internals book, and Clayton's Volume 1. A Molyneaux
listing from the ST Format does some initialization for VBI:
VBI equ $70
My thinking is that maybe this is a register, because later in the listing:
move.l VBI,old_vbi back up the old vbi
move.l #_vbi,VBI patch in the new one
bsr _main
move.l old_vbi,VBI
and so on. Most of what's going on is understandable to me, but
I was unable to find in my meager references which register $70
might correspond to, if indeed it is a register. Any suggestions?
Oh, this particular sequence is in supervisor mode.

Does this apply to UK Falcons as well?
I bought a 4/65 Falcon and did get Multitos but neither Speedo or Works.
Should I?
I was told that if I just bought the 4meg no HD model I couldn't get
Speedo, Works or Multitos, even if the dealer added in a bigger drive
themselves.

You might consider Cyberdrome - one of J Hutchinson's games but I forget
the name of the company currently marketing them.

Another game - this one allows up to nine players at once and each can
be on their own ST (or up to 2 players on one ST - one using mouse, one
using joystick) is a card game that is a little like multiple solitaire
game is called Nertz. Linkages can be either midi cables or modem/
null modem. I think this would be really great for a party game.

The name of this distributor escapes me right now - I'd guess Toad
may have copies in or send me email and I'll reply tonight with
address/phone numbers. Party on, Wayne

From: azog@world.std.com
Message-ID: <Cv3zJ5.Kr2@world.std.com>
Source record: 181575

This might be a goofy question, but I havent seen it asked before

Does there exist, or is there interest, in a CD-ROM snapshot of
the Atari directories at atari.archive.umich.edu? I was even thinking
of something like a quarterly issue or something, hell I would pay $30
for that.

I ask because its nearly impossible to get into it, and the other
"worthwhile" mirror, wuarchive, also requires an act of god to
access.

Now if nobody has the resources to create a CD-ROM, I might be able to
offer something here, as we are just about to purchase a Kodak
CD-ROM writer system, but the problem is getting the files
from there to me...

Try the mint version of emacs (18.59) that is up in the mint directory of
atari.archive. This works great both on my Falcon/TT, and it offers
everything that emacs on real *nix can do as well.
(Sub processes, like make or a shell in separate windows, etc. etc.)

2840. Re: Archive Efficiency Improvement

Newsgroup: comp.sys.atari.st
Date: 1994-08-25 22:01:02 UTC
From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <33j4au$2pc@charm.magnus.acs.ohio-state.edu>
Source record: 181579

Two quick points:

One re. msg describing files that fit into more than one area. That is easily done with links. The don't use up much space and are pretty much transparent to the end user. I digress though...

Two. re. archive site for programming. We already have a partial one for STOS, and almost every other platform seems to have at least one site that is the major repository for source code. We have a large number of sites that see very litle action. It would be nice if we could find someone at one of these sites to take up the cause. I used to program in GFA, I have since switched to C. But I have a sizeable amount of GFA code laying around that I'm not doing anything with. I personally find it somewhat painful to use GFA anymore (No flames please just my personal opinion) It would be nice if there were somewhere all of us who have old code that we don't plan to touch could put it up for others to use. The same I'm sure goes for C programmers and any other language that exists for the Atari. Plus there are programmers that have left the atari fold, wouldn't it be nice if we could get some of them to release their old Atari code (whatever wouldn't conflict with their business or copyrights) so that those of us who enjoy these machines and plan to play with them for awhile could look at their code and update it? Jeffrey Bilger was nice enough when he left the atari to release the source code to his Dangmier system. I have to agree with Jim on this point the need exists for a real site to organize and store our old sources. And It would be ludicrus to place this archive at one of our already active and vibrant sites. Why not breathe some life into a languishing site instead of overloading a.a.u.e, ftp.tu-clausthal, ftp.cnam.fr, ftp.uni-kl.de or Hensa. These sites are already busy.

Well enough of my pontificating, I was just tired of watching a good suggestion fall into a fight over the file structure at Hensa and the wonders of Gopher.

>I have a hellaciously large German dictionary (from my son), and
>still can't figure out what half the stuff in Jr. Office was. I
>finally bought Straight Fax instead! One lost sale for him! It
>pays to be nice to the customers! Heck think of all the Sales
>in China alone 8-)

Oh I agree - but not every program I come across can be expected to have documentation in English.

For instance, there must be piles of source code on FTP sites (and now CD-ROMs), which only has German comments, and an out of date email address as the only author contact. In cases like this, you might as well translate the comments/docs yourself.

The only problem is that I've always been bad at natural languages. This is why I've set my goal at being able to *read* German. Writing or Speaking it is likely to stay beyond me, unless I find I have a pressing need for it.

My current solution it 2 pronged:

1) Automative German -> English translation software. There are a few such packages around, and I'm going to look at them.
2) Frequent use of large dictionary ;-)

:-)

Roland.

One possible solution that I have seen on other sites, is to compress
*.TOS files again with gzip so you get program.tos.gz as the file name.
This isn't elegant, but should work.

BTW this isn't a flame, (I find hensa quite a nice site for the way I get
things) just a hopefully helpful suggestion.

MidiBattle will also allow you to network two machines together via Midi.
Lot of fun and nice graphics. Only allows two players though...

There is also an sci fi adventure game called jitterbugs or something
along those lines. It's available on Genie, but I haven't seen it anywhere on
the net. I lost my only copy during a hard drive crash or I would upload it to
the net. Anyone else have a copy?

From: sccoe@ucscb.UCSC.EDU
Message-ID: <33jnoa$g6u@darkstar.UCSC.EDU>
Source record: 181590

I have an SM124 Monochrome monitor for the ST. Crystal clear & paper white,
To go along with it, how about Spectre GCR with ROMS and a bunch of old Mac
B & W games?
I also have a IBM Proprinter (9 pin Epson clone) to throw into the deal.
And anyone need an extra 1040STF? This one works perfect except for one
MINOR %-) detail: the disk drive is read-only (it believes for some reason
that all disks it encounters are write-protected).

So, send me offers. I'll sell it off to ya with cables and all for one
huge package deal if you want or pawn it off individually to whoevers
interested.
cya later.

2855. New PC emulators for Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 03:37:11 UTC
From: sccoe@ucscb.UCSC.EDU
Message-ID: <33jo17$g8c@darkstar.UCSC.EDU>
Source record: 181591

So I
am wondering (oops) what happened to those PC-emulators that are supposed to be coming for the Falcon? I have heard nothing about the Shareware software-emulator and the 486-board seems to have turned into vapor. Whassup? Nothing seems to be happening in the Falcon market! (yeh... don't tell me to do it myself). Anyway, does anyone out there have any news?

And how about that Genlock board for the Falc?

2856. Huge RGB "monitor" on Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 03:45:11 UTC
From: sccoe@ucscb.UCSC.EDU
Message-ID: <33jog7$g96@darkstar.UCSC.EDU>
Source record: 181592

There is this big-screen TV-like thing that I found at my local junk-shop.
It's probably 48 inches at least and is selling for only $199.
The catch is that it doesn't have a TV tuner built-in.
So, I'm wondering...
1) How good would it be as a monitor for a Jaguar or Falcon?
i.e. would there be any way to go beyond 640 * 400 interlaced on it,
because that would be awfully foul indeed on such a screen (for work,
of course $-)).

2) Just because it doesn't have a Tuner, I could still use it as a Television
via RGB cables from my VCR / Cable Box....right?

So should I get it? What kind of adaptor would I have to put together to
get it to run with a Falcon (it uses 3 seperate R/G/B in ports, I believe).
tia.

2857. FS: Atari Master Tracks Pro sequencer

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 05:14:12 UTC
From: mcwilliams@wmich.edu
Message-ID: <1994Aug26.011412.20827@wmichgw>
Source record: 181595
Cross-posted to: comp.sys.atari.st,rec.music.makers.marketplace

Master Tracks Pro sequencer for the Atari ST. Will run on TOS 1.0 and up. 64 tracks, linear, has song overview window, piano edit window, controller data edit windows, Instrument list window (like a track sheet).
This sequencer is very clean, straightforward, and easy to learn. It's great for beginners because the user interface is so easy to get used to. It can also please most mid-level and advanced sequencer gurus. (Ok, so it's not Cubase or Logic).
Complete with manual. Paid $300 a couple of years ago, asking $75 (includes shipping & COD cost).

Please reply to MCWILLIAMS@WMICH.EDU

2858. NeST & AtariNet Piracy??

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 06:46:46 UTC
From: dbrewood@nest.demon.co.uk
Message-ID: <940826Z064646.156dbrewood@nest.demon.co.uk>
Source record: 181476

Shortly you may see mail posted from Rickard Troedsson concerning software accusations of rife piracy going on in NeST and AtariNet.

I wish to publically state that piracy is frowned upon in both networks. In fact Rickard had been asked to clear his own system of pirated files 2 years ago, which he did, if this had not been carried out he would have been expelled from NeST. I still have logs showing what piated files were available for download as I downloaded some from his system as proof if it was required.

Rickard has now left NeST of his own free will after disagreements with a support message echo gated from AtariNet into NeST. If he had not terminated his network connections with next voluntarilly he was to have been expelled for refusing to follow moderators/RC/ZC's instructions.

Rickard has threatenned to try to blow both networks out of the water with accusations of piracy against members which he says he may post in this group.

To me this is pure 'sour grapes', so if you see such a message please disregard it as it will be designed to try and cause trouble to both networks.

>>It screws up the screen totally on my Falcon with BlowUP030 Hard II.
>
>Has to be because of BlowUp then.

Only partly. If TurboGIF detects a 256 colour mode it should at least try
to use that.

>I didn't knew MGIF worked on the Falcon. I have used it on my STE (in mono)
>to be able to view gif files fast.

Even mgif 4.2 works on the Falcon, but the new 4.4beta is _very_ much
improved. Among lots of other things:
- GEM interface with menu and dialogs
- Handles images in mapped and true colour.
- Can display both mapped and true colour images in any ST/TT/Falcon mode.
- Reads GIF/JPEG/PPM/Targa/PI?
- Writes GIF/PPM/Targa

Since yesterday, mgif is very close to the same speed as TGIF 1.2 at loading
GIFs. It might be faster, but it's hard to do accurate timings.
Mgif draws the image to screen _much_ faster, though, so it wins by a good
margin when it comes to load and display. :-)
Someone mentioned that there was a v1.3 of TGIF. How has it changed?

The latest mgif can load and display a typical GIF, in 640x480x256, in about
half the time it takes Speed of Light 3.5 to just load it. :-)

>Yep. MGIF has done a great job on my STE.

Glad to hear you like it.

>Sure would like to see when you finish MGIF for the Falcon.

I'll mail the beta version to anyone who asks for it. I don't know of any
bugs right now, but the interface still needs some improvements.

In a week or two I intend to post a final call for beta testers, but if
anyone is interested already, please mail me.
Perhaps I should say that I don't expect all, or even many, 'beta testers'
to actually report bugs. All I really want is some feed back and ideas.

>Maybe you can explain why TGIF isn't bigger than 3Kb. Normally when we see
>a gif (or whatever) viewer they'r alot bigger than that ?

A GIF decoder without fancy features is actually a very small routine. The decoder itself fits nicely in the cache of an '030. If I extracted the complete GIF loading and display code from mgif it would probably be less than 10kb, including the C libraries. The complete mgif is about 200kb. TGIF is completely written in assembly which is why it's even smaller.

Steve Wells (wells_s@kosmos.wcc.govt.nz) wrote:

: That part is point of view. A 10-sector per track floppy could either
: be counted 0-9 or 1-10. An 80-track disk, 1-80 or 0-79.

I was determined _NOT_ to join in this thread but I just _HAVE_ to
correct this point:

The sectors of a disk cane be considered in two ways:

1. Physical sectors which are confined to a single track and
are numbered starting from 1

2. Logical sectors which cover the whole disk (or partition
in the case of hard drives) and these start at 0

Therefore LOGICAL sector 9 will be PHYSICAL sector 1 on the second
track (track 1) of a standard floppy disk.

I hope this clears up the confusion but I doubt if it will :-)

John.

2861. FREE Computer Equipment!

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 07:38:58 UTC
From: chris@globe.net
Message-ID: <029182IRIXSFNDBPDYWH@globe.net>
Source record: 181440

- We got it free... we're giving it away! -
* Come & Get It! Free Equipment! *

Can you believe that someone would offer you free equipment for no special reason? Well, we will at 1! GlobeNet Place! BBS. If you send $5 to belong to our mailing list, or logon our system and become a registered member of our system, we'll include you on our free equipment mailing list! Dial up the best and fastest growing BBS around!

Local phone #s are: Baltimore: 410-792-9409
Washington: 301-552-4414

The list will be mailed to all members of the mailing list over a three day period. This begins once we have collected enough equipment to make it worth everyone's while. It's first come, first serve for the equipment and there is no guarantee. Most of the equipment is used and is in working order but all equipment is shipped to you as is, C.O.D. shipping costs. You pay shipping and an annual fee to belong to the list. That's it! Nothing more!

You can also receive this list online as a paid/registered member of our BBS (annual accounts only) for free. Because of snail-mail speed, those who receive the list online will have first serve rights on the data therein, so active members will receive the best items from the list because of the lists first come, first serve nature. Those who choose to use the list by snail-mail will receive the list a few days later.

Our biggest insistence is that you do not ask for anything in particular when you ask about the list. We're sure everyone wants a Pentium machine and a gig hard drive, as well as a couple 57,600k modems but, what's there is what you choose from and trying to purchase items from the list in advance is not permitted, out of fairness for all members participating in the list.

We can't emphasize this enough. We take donations of hardware! So, even if you don't want to be on the list, we can always use your hardware. Even if you don't want to be a member, we can always use your hardware. If you have something, anything, laying around that you don't need, consider sending it in to our BBS so that we can mate it up with a user that has a REAL need for whatever it is. Perhaps you think there's noone out there using 300 or 1200 baud modems? Wrong. Your old equipment after upgrades, and even collecting the old 'unusable' parts after repairs can be of great value to this BBS, and to the users who desperately need it!

You don't have to be a non-profit organization, or a charity or anything. You just have to be a user of 1! GlobeNet Place! BBS, or a subscriber to the mailing list.

We have equipment such as Commodore, IBM, and universal equipment such as external modems, printers, hard drives, and so much more! New material arriving all the time!

How can we do this? Easy. We collect pieces of used equipment that is either useless to the owner because of upgrades or obsolete to the owner for a specific task. We also do bulk purchasing of hardware and software and end up with many things we just can't use. It's just too cheap for us not to say, no, don't throw in those extra two drives for nothing... We piece this together to create working computer systems. We, of course, have your run-of-the-mill collection of modems, computers (currently 386 and 486's!), monitors, power supplies, cases, dumb and smart terminals, printers, drives, memory, cards of all forms, and so much more. Most of this equipment is donated by our users, some is donated by local businesses.

You respond to our snail/electronic mail online, or via postal service, and let us know what you would like to pick up or have shipped to you. If it's shipped to you, all you pay is for the shipping charges.

What are you waiting for? Send that $5 in today!

: continue to use my color monitor SC1224 hooked up to a PC with a decent
: graphic card, so that it will be recognized?
: Would it eventually be able to handle Windows? (:-)

: Just asking, somebody once told me something vaguely like 'CGA'-standard.

: Thanks for your input, Elmar

Forget it! You have to pay a SVGA-Monitor, if you want to use WinD*ws in
an acceptable way! And the PC should be a 486DX-40 or better with 4 MB RAM
minimum and 250 MB HD.
I don't understand why you want to downgrade a well running system B-)

If your dealer added the HD you get nothing. If it was Atari factory fitted then you are entitled to Speedo, MTOS and some utils plus extra manuals. You do not get Works if you buy a machine in the UK - it's 110GBP extra from Hisoft.

I'm working on the latter. Insignia who wrote SoftPC are happy for it to go shareware.
Atari UK have contacted Atari US who own the rights to see if this is a possibility.
Atari US are probably too busy to look at it at the moment so it's up in the air.

|> And how about that Genlock board for the Falc?
There is one in the UK - it was demoed at the last Atari show. Can't remember the firm
off hand.

2866. ExtenDOS Patch to v1.21 now available at HENSA

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 11:11:08 UTC
From: vctec@westminster.ac.uk
Message-ID: <Cv533K.JDM@westminster.ac.uk>
Source record: 181514
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

```
From pddanny@uk.ac.hensa.micros Fri Aug 26 12:02:14 1994
Date: Fri, 26 Aug 1994 12:01:18 GMT
Subject: EXTENDOS PATCH Update older versions of ExtenDOS to 1.21

It's online as file micros/atari/tos/o/o095/edos_121.lzh

This patch updates Anodyne Software's ExtenDOS package to
version 1.21. After applying this patch, you will have the
following versions of these ExtenDOS modules:
CD.BOS 1.6
EXTENDOS.PRG 1.4
TRACE.TTP 1.6
UNIDRIVE.DOS 1.5
UNI_BDDS.DOS 1.5

NOTE: All users of ExtenDOS version 1.20 should apply this patch
since it fixes several significant problems in version 1.20.

We also strongly recommend that all users of ExtenDOS v1.0, v1.1,
and v1.11 apply this patch.

This archive contains the following files:

PATCH121.TOS Patches the main ExtenDOS modules
CHECKIT.TOS Checks the patched files
CHECKIT.CTL Control file for CHECKIT.TOS
TRACE.TTP Replacement for existing TRACE.TTP
READ.ME Important documentation on version 1.21
READ_ME.1ST

New Features:
* PhotoCD Support (single and multisession).
* All known problems and incompatibilities have been fixed.
* Boot up messages now readable on a 40 column screen.
* UNIDRIVE.DOS now detects certain errors in the path table of a CD-ROM, and
automatically uses the alternate path table.

Bug Fixes:
* PhotoCD now works correctly on a Falcon
* NEC25 drive now handled correctly
* Path tables larger than path buffer now handled correctly

File size: 80896

It's online as file micros/atari/tos/o/o095/edos_121.lzh

HELP HELP.... AUTO OVERSCAN....!!!!

This is now my 3rd posting regarding how to upgrade
my version 3.0zh of Overscan to the latest version,
I was informed that its now 3.0zm..??

Or is there version 4.x ???

Can some one please help me, I did e-mail to Compo UK and recieved no reply,
another person told me to contact Karsten Isakovi'c..

Karsten did respond to my first posting and gave me the latest version number,
but he is no longer invoved, with this program or was it Overscan..

If this is the kind of support you get with German software, never never again
will I recommend German software to any one....

I have allready got my fingers badly burnt by buying Script, so I should have
known better...

Why can't Overscan do it the same way Michael Ziegler does it with GSZRZ,
and use a BBS for support, at least Michaels system works, and is simple and
not that expensive...

So Please support you users...!!!!

I bought a factory fitted 4/65 Falcon. It came with Multitos, calappt and
a couple of other things. No Speedo and no Works.
Is it worth trying to get Speedo, now that there is a new version out now
which I will presumably have to pay for anyway?

In a previous article, rene@bianca.amd.com (Louis R. Castro) says:

>Hi folks,
>
>I'm trying to find an ST word processor program that can read and write MS
>word files. Is there such a thing and what is it called.
>
>thanks for your help

Ermm... I know MS Word 2 and Word 6 can save in a format called Microsoft
Rich Text Format. Several ST word processors can inport this standard. I
know Marcel V2 can. This is shareware and can be found at
atari.archive.umich.edu in a directory something like Applications/wordproc.

I believe that Protext (no idea what version) can also import the RTF format.

Hope this helps

Roy

Message-ID: <xm4R9zt.lmcclure@delphi.com>
Source record: 181513

In a message dated 8-24-94, Gregory Bernath said:

"Is there some historical reason why drive M seems to be a
default for ram disks?)."

Historically, this does seem to date back to C/PM systems (at least).

Logically, M *might* have been the highest drive number that was
normally supported. However, I expect that it was simply a mnemonic
(i.e., "M = memory").

Personally, my choice (so far) for a RAMdisk is the one that was on
one of the old "COMPUTE's ST Disk and Magazine". It survives a warm
reset, can be set to any letter, and can autocopy any files you
designate. It has been with me since the days of owning a TOS 1.0
520ST to my present STe under TOS 2.06 and keeps on ticking.

I have Codehead Utilities, but have yet to try CODERAM, since the
CSTD&M RAMdisk has been serving me so well.

MB> I`ve bought an atari 260 ST with monitor SM 124 and floppy SF
MB> 354 for DM 40,- What can I do with this stuff?

ANOTHER one?

That's the THIRD reference I've had of anyone owning a 260 ST.
Looks like there are more of those popping up than I realized. :)

Since the smallest memory capacity that I've ever had is a 520
ST (and I found that too little memory) I'd recommend getting some
sort of memory upgrade.

The best thing, though, may be just getting a bunch of
PD/shareware together and see which ones run to your satisfaction.

Good luck!

Well, you can have Ataris Speedo for free which uses Speedo fonts only. There is a nice set of 50-odd fonts that WP do for about 35GBP in the UK. Otherwise, spend 50GBP on the Compo Speedo and use the thousands of free TrueType fonts. Actually, check with Compo, I think you can upgrade from Ataris Speedo to theirs for a smaller fee.

Far be it from me to suggest munging up the net even more than it is, but
the program "ncftp" has an autorepeat mode. Wuarchive usually only takes
a few tries (in the evening, at least). For anonymous ftping, Ncftp is
far better than the stock ftp command. Ask your system staff to install
it, or compile up a copy yourself.

I'll email this as well, but it might help others so I'll post too.

Firstly, the authors of several of the common archiving programs anticipate this problem, and distribute their programs in self-extracting archives. This means that you simply run the thing and it will auto-extract itself. Also, there is a file called starter.tos on atari.archive.umich.edu that contains several bare bones versions of the common archiving utilities. It too is a self-extracting archive, and is designed to help folks get started.

Second, if you do not have a hard disk, you will probably need to set up a RAMdisk to use for extractions. There are numerous RAMdisk programs out there. I can personally recommend Eternal (edisk21.arc on atari.archive). You then want to create a floppy that sets up a RAMdisk on bootup, and that contains your archiving utilities. You can even have the disk automatically copy some files to the RAMdisk on bootup (like the archiving utilities, which will obviously run a LOT faster from a RAMdisk).

So, to get started, grab starter.tos and starter.readme via ftp from atari.archive.umich.edu, write them to a MSDOS compatible 720k floppy disk (or download them via modem), and you should be pretty set. Get the 0index file as well, and settle in for some serious reading (it is a bit large).

What would be useful is a Ger2eng that for every german word A yields
an English word B which is not longer than A, so that you can run it
on a binary file (.RSC, .APP) for immediate translation. I was thinking
of such a utility for translation of my Edith text editor binary to
German. (I.e. using Eng2Ger).

My thoughts went as far as to apply 'longest match' so that you can
extend your dictionary with whole sentences, so as to finally obtain
dictionaries which can perfectly translate one specific application.
I know this sounds silly but later updates of that program will be
likely to have much the same text but at other places in the binary
file.

Compo UK have 3.0zg so your ahead of them! They are not expecting an update at the moment but said when/if it's updated, you can get the new version for a nominal fee ie a blank disk and return postage. The email address you should use is compo@cix.compulink.co.uk - that *should* get you a reply.

There are plenty of quality PD Atari files that AREN'T on the net. And
as it stands now, there is not enough room for them on all the archives.

You've missed the point. Is there a need for every site to have their
own personal copies of the files? Absolutely not. A filesystem like AFS
or NFS would be just as effective and save a great deal of space on the
net.

Sure, space is cheap, but let's use our space wisely. As a good friend
of mine says, "There is only one kind of drive: too small."

I am fairly confident that it does not work, alas! Using backward, I could
get it to recognise the '030 and load the music. It went throught the intro
sequences (at high speed ! Looked promising) and got all the way through to
starting the first (or any other) mission and locked up before any animation
started (i.e. first frame). Reminds me of the lock up you get with Starglider
as soon as you move the mouse.

If anyone gets it going, let us know as this would be great!

Ben...

2890. Studio Convert (Compo)

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 17:44:49 UTC
From: trek@intgp4.ih.att.com
Message-ID: <Cv5LAp.A0L@nntpa.cb.att.com>
Source record: 181528

OK folks, you might have to try this to believe it. I have been playing around with Studio Convert - takes about a minute to load in a 1.1M jpeg picture (maybe it was a little longer than that. I then moved the DSP jpeg loader into my auto file and tried again.

All I can say is WOW. This is like the move from floppies to a hard disk. Now I know why I got a Falcon instead of some other lesser machine. OK, OK put away your flames - this was intended for the Atari lover in you. As we see programmers learning to take advantage of the DSP, we are going to start seeing some amazing things on our computers.

BTW - the DSP load took somewhere between 6 and 7 seconds. Same file, same program but using the OUT option on the load which uses the DSP jpeg decompressor....

The program supports reading something on the order of 20 or more different formats and can write to a dozen or so. They have added a few options to the program which seemed more in the domain of Studio Photo. Not real sure why they included them here. But on the whole, the program seems pretty darn good. I haven't tested out the conversion capabilities much yet so no real words from that area. Wayne

2891. Civil color patch for Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 17:47:52 UTC
From: trek@intgp4.ih.att.com
Message-ID: <Cv5LFt.A57@nntpa.cb.att.com>

Can anyone tell me where (site and path) I might find the Civilization color patch so that the game will run correctly on a Falcon? Wayne

2892. Atari bombs

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 17:51:51 UTC
From: 9302442@meo.lacitec.on.ca
Message-ID: <9302442.11.2E5E2BB7@meo.lacitec.on.ca>
Source record: 181525

I used to use my Atari ST everyday.... I'm now hooked on my IBM compatibles (running a BBS off of them).

Anyways, I have 1 question to ask you ST users: Aren't you sick of seeing those damn little black bombs everytime the computer freezes??? And that other bug with the video chip where you have to slam the keyboard just to " wake it up"...

BTW, Xenon II for the ST is still the best game I've played on it :) Well, my class starts in 8 minutes, so bye!

2893. Help with SLM805

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 18:41:36 UTC
From: daveh@netcom.com
Message-ID: <davehCv5nxC.CpG@netcom.com>
Source record: 181534
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have an SLM805 but the actuall software for it is missing, I have the manual for the diablo emulator but no disks. I found the emulator on some ftp sites but this is not complete (missing the required fonts at least) I would be greatfull if someone can supply me with copies of the original distribution disks, I don't think this is a breach of copyright this software was supplied with every laser (mine included, I have the manual) and will only work with the Atari laser.

Please help.

Dave.

> of mine says, "There is only one kind of drive: too small."

True, but "net space" is a disjoint, disorganized phenomena. The collection
of people that are "Atari archiver folks all over the world" have no common
command structure, and probably don't all speak English (or any other
language). We certainly don't all know each other. Most of the people
that manage ftp sites are volunteers that do it in their spare time.

Also, at least in the case of atari.archive.umich.edu, I view that which
we are doing as offering a service, not just a set of files. Our goal is
"One-stop shopping for Atari stuff". Thus, I do want us to have copies of
files that exist elsewhere, because I want atari.archive to have as complete
a set as possible (and the best indexed :-). I presume that other sites
around the world have similar goals. This leads to a lot of redundant
copies of files, but it also leads to better ftp sites!

Thus, your suggestion is one that has lots of technical merit, but is
logistically unlikely at best. Long-haul NFS is far from perfect, and
AFS costs a considerable amount of money. Even if that problem was solved,
the amount of personnel coordination required would be staggering.

wrote:

>I'm lookin' for a Flight Simulator with instrumental equipment
>(VOR/DME, ADF, Atitude Inicator, etc.) and som sectional charts for
navigation.

The best one is perhaps Airbus 320 ,two versions are avaliable one
for the US and another one for Europe. It doesn't have ADF but
VOR/DME ,ILS etc. are avaliable. High altitude navigational charts
are given as well as ILS approach charts for about 80 airports. It's
from the German Thalion company .. .

The other one is the classic Fligh Simulatior II. A very nice
simulator but getting a copy nowdays might not be easy.

Yes.
And Yes.

I have borrowed 3 CD-roms filled with gif's, and would be very happy to
betatest the program for you on my Falcon/VGA, TT/Bigscreen.
Both are of course running multiTOS (AES 4.1/MiNT 1.11)
- so lets see how it will work with memory-protection enabled :-)

You probably don't support the new iconify calls and stuff, but if you
want, you could get code from me that shows how to do it !

dR> I'll mail the beta version to anyone who asks for it. I don't know of any
dR> bugs right now, but the interface still needs some improvements.

I could make some suggestions... and even help a bit if you're stuck.
Besides a friend of mine is *very* picky on interfaces, and has helped me a
lot to design nice GEM applications. Try contacting him as well, it might
result in you getting a completely new .rsc file back :-)
(He is good at it)

I just thought I would post a bit of good news about Atari for a change :-).

I sent Atari my MegaSTE for a new GST Shifter chip and some other bug fixes, and have just received it back. Total turnaround time was about a month (including shipping both ways). They fixed everything, and did not charge me a cent! This was on a machine that was out of warranty before I bought it (and that was about a year ago). I consider this to be quite cool.

Anyway, Atari can still fix their computers, and seem to be willing to fix factory defects regardless of whether or not the computer is still under warranty. Their customer service number is (408) 745-2000.

2903. Accelerators -> smoke and fire..?

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 22:20:20 UTC
From: THIETAVUO@FINABO.ABO.FI
Message-ID: <1994Aug26.222020.1408@abo.fi>
Source record: 181550

Some Falcon-related questions to People Who Know.. ;-) !

1) Is the original 68030 a 16 MHz version or faster (as ST-Computer magazine suspected)? So: is it safe to accelerate it to 32 (or even 40) MHz without heat sinks, extra fans, etc - or at all..? Experiences?

2) Followup to previous subject: does anyone own a German DDD Screen Resolution Card..? That thing accelerates F-030 up to 40 MHz (with original CPU), and (more important, I think..) raises the bus speed from 16 to 20 MHz. It accelerates DSP and FPU as well, if so wanted. It seems to be a high-end graphics enhancer, too (even better than Blow-Up, SB2, etc. ?): e.g. 1024 x 768 / 70 hz NI, 800x600x256 70 hz, and so on.
This little miracle isn't expensive at all - but does it really WORK..?

3) Why doesn't CONNER 340 MB SCSI-drive (new model) autoboot connected to Falcon..? A friend of mine wonders that; his previous Quantum LPS 105 worked without problems... Otherwise everything OK - but no autoboot, no matter how he formats the drive. HDX and ICD Pro Tools have been tested - but I personally suspect that there is a hardware problem in new Conner drives (connected to Ataris..) ? That's because I myself couldn't get a Conner 1.3 GB drive to work reliably with Atari TT (Hewlett Packard finally did the job..). So, what's the problem with Conners? Parity? Any help possible?

4) You who have "real" accelerators (w. Fast-RAM, 68040, etc..): will there be compatibility problems? How about games (e.g. does Backwards quit working?) ?

5) Geoff Crammond somewhere: please, make a ST/Falcon (!) conversion of your forthcoming Formula One Grand Prix 2 simulation..! ;-)

That's that this time. Thanks for any help!

Tommi

2904. Elite II and Civilization

Newsgroup: comp.sys.atari.st
Date: 1994-08-26 23:28:49 UTC
From: eliassen@aviris382.jpl.nasa.gov
Message-ID: <eliassen-2608941528490001@avirislab.jpl.nasa.gov>
Source record: 181538

Does anyone still have those "fixes" to eliminate the unwanted "features"
in these two games?

Any help would be appreciated. Thanks.

Miraden (please respond with E-mail)

: : idea what the name of the Calamus font is that is being used?????
: : For those who havnt seen that issue, the only way I can describe the
: : font is that it is oozing blood. It reminds me a bit of the MUNSTERS
: : logo. If anybody knows it, can you tell me if it is commercial or PD??
: : And where I can get it. (Maybe someone would like to uuencode it to
: : me???? 8-)).......Glenda

--
Not having it in my hand at the moment I'd say the font you described is
one called Post Crypt (cute huh). I've seen it called Horror also but
its PD. I have a copy of it if you would like me to UUencode it and mail
it to you. I'd be happy to.

Besides I'm a font fanatic myself and am getting close to 1500 Calamus fonts.

: thed@mtek.chalmers.se

--
Although I don't know what Atari you're using I do know that Clarity 16
for the Falcon will do MIDI sample dumps but I dont' of anything else at
this time that will. Maybe the new version of Soundlab will when its
released. Maybe not but its still a cool program.

I still don't get it. TGIF sure switch to 256 color mode when displaying GIF
files.

>Even mgif 4.2 works on the Falcon, but the new 4.4beta is _very_ much
>improved. Among lots of other things:
>- GEM interface with menu and dialogs
>- Handles images in mapped and true colour.
>- Can display both mapped and true colour images in any ST/TT/Falcon mode.
>- Reads GIF/JPEG/PPM/Targa/PI?
>- Writes GIF/PPM/Targa
>
>Since yesterday, mgif is very close to the same speed as TGIF 1.2 at loading
>GIFs. It might be faster, but it's hard to do accurate timings.
>Mgif draws the image to screen _much_ faster, though, so it wins by a good
>margin when it comes to load and display. :-)
>Someone mentioned that there was a v1.3 of TGIF. How has it changed?
>
>The latest mgif can load and display a typical GIF, in 640x480x256, in about
>half the time it takes Speed of Light 3.5 to just load it. :-)

HMM!. I think i either misunderstood MGIF, or then i have been to lazy to read
the manual 8-)

>In a week or two I intend to post a final call for beta testers, but if
>anyone is interested already, please mail me.
>Perhaps I should say that I don't expect all, or even many, 'beta testers'
>to actually report bugs. All I really want is some feed back and ideas.

You sure got my interest. An good idea is to include a slideshow. When the
display is a fast as you say, a slideshow is really needed. And i know many
people out there is waiting for such an option 8-)

>A GIF decoder without fancy features is actually a very small routine. The
>decoder itself fits nicely in the cache of an '030. If I extracted the
>complete GIF loading and display code from mgif it would probably be less
>than 10kb, including the C libraries. The complete mgif is about 200kb.
>TGIF is completely written in assembly which is why it's even smaller.
>

I just knew it was something around the cache 8-)

Pardon me for asking this, but I keep seeing http:/<pathname> for WWW, now what EXACTLY does that mean and how do I get to it from the tcsh prompt?

Command me: www
WWW Alert: Can't access document.

WWW can't open http:/info.cern.ch .. etc.

That is what I get when I type WWW at my system.

What am I doing or not doing here?

Thanks.

P.S. Give instructions from the tcsh or csh prompt (or telnet).

2911. Atari stuff for sale!

Newsgroup: comp.sys.atari.st
Date: 1994-08-27 03:50:51 UTC
From: japolis@nyx.cs.du.edu
Message-ID: <33md6r$ggo@nyx.cs.du.edu>
Source record: 181546

Hello! I have the following items for sale or trade:

"productivity stuff"
Codehead Utilities, release 3.....$10.
G+PLUS 1.3.....$15.
MultiDESK 2.1.....$15.
Mini Office (Nicely done graphs and stuff, from UK) .....$25.
Spectre GCR 3.0 complete with system software and a big bunch of disks of utilities and programs to get you started.....$200.

"fun stuff"
OIDS and PINBALL MAGIC (games).....both for.....$15.

"books"
THE GUIDE TO CALAMUS DESKTOP PUBLISHING.....$25.

Or.. how about..... All for $225.

Add $2.90 for shipping, or shipping is FREE with three or more items!
Payment forms acceptable are Check, MO, or trade for any of the items below.
I am looking for Tracker/ST, STeno, Studio Photo, Imagecopy 2, True paint, Warp
9 v3.80, or EdHak or who-knows-what. Let me know what you have! (please legal only, with disks and docs) Call (303)473-0511 or EMAIL to JApolis@nyx.cs.du.edu or jeffApolis@aol.com

Thanks!

We at Compu Ware spole with Compo USA yesterday and were informed that
the 486 emulator was to be available in October. The FalconGEN was I
beleive a proto-type shown at FEZaBit Germany show and likely to be and
end of year release. Don't kid yourself, the users in Europe will tell
you things are happening with the FALCON!!

2914. The Fate of Atari Computers

Newsgroup: comp.sys.atari.st

Reading a few days back here, someone posted a message saying that they had a copy of Atari's Shareholders meeting results.
They stated that Atari had ceased production of their computer line and would not be producing any further computers than the Jaguar product.
As dealers since 1986, we have not heard any such truths to this from Atari themselves and as I last read and heard this recently was posted in June from James Grunke at Atari:

REPLYADDR RON ROBINSON @FNET 224

REPLYTO 51:1/0 FNET

From James Grunke Director, Atari Music and Audio:

. . . . . .

Dear Atari Friends,

Last Friday (June 17) at the Atari annual stockholders meeting, Sam Tramiel announced that Atari is licensing Falcon030 technology to C-LAB GmbH of Germany in order to have continued development of a pro-audio/music multimedia workstation. We are confident that the proprietary Falcon030 technology can be competitively developed with dedicated hardware and software to support the growing needs of pro-audio, broadcast, and multimedia production. C-LAB GmbH has extensive experience in developing and marketing multimedia software and pro-audio hardware. Product details and specifications will be released at a later date.

Atari will continue to manufacture and support the Falcon030 in its current configurations as the market demands. Atari is considering further computer products based on the Jaguar chip set, the worlds first and only 64-bit interactive multimedia home entertainment system.

Thank you for your support.

James Grunke Director, Atari Music and Audio

Please note that they say, Atari will continue to produce the Falcon in the 1 and 4Meg Ram configuration with and without hard drive, whatever is available at time of production. There has been demand on the Atari TT as well and as far we know it will also remain in production due to demand. Please cast your fears aside that Atari no longer wishes support to us, but rather encourage and wish them success with any product that makes them profitable again! Perhaps in the future will see the Atari 64 BIT Computer.

regards,

Eva Crouse @ Compu Ware

That is a URL (Universal Resource Locator). Perhaps the most common www
client is Mosaic. In it, one would click on the "open" button, then
input the URL, then click "open" and it would magically happen. I'm not
sure about command line clients, but look around for URL in the man page.

I am ;-) I managed to unpack the Medieval Chess archive and play it
without a problem - possibly you have a bad disk? Anyway, I'll extract
and re-pack the full game archive and post it on a.a.u.e this weekend.
Anyone else come across this problem?

John Collis (john@albemuth.equinox.gen.nz) wrote:

: One possible solution that I have seen on other sites, is to compress
: *.TOS files again with gzip so you get program.tos.gz as the file name.
: This isn't elegant, but should work.

: BTW this isn't a flame, (I find hensa quite a nice site for the way I get
: things) just a hopefully helpful suggestion.

I am sorry if my replies regarding hensa, make it seem as though I
think people are flaming me....I do apologise....I do not take any
suggestions as flames. Instead I think about them, before replying.

The method you have suggested is a good one. I will consider it in the
future, when I get TOS programs, for the main section. The difficulty
is that in the /tools directory, I have modified the archives...so that
they have a .TOS extender, instead of the one they came with. This was
to make it easier for first time users and such to just download the
programs, and then easily unpack them.

The archivers in this /tools directory, are also to be found in the
main archive section...with their native extenders....all apart from
LHARC 3.10, which comes with a .TOS extender. What I have done here, is
to simple change the final .TOS with a .LZH, which can then be
extracted with LHARC, or simply changed to .TOS when downloaded, and
unpacked that way.

Thanks for all your suggestions....I always look forward to receiving
them.

Regards
Danny

You can't compare TGIF and MGIF to Speed of Light because when SOL draws the image, it is doing many things IN REAL TIME while it draws:

- Scaling to any pixel, width and height!
- Converting original palette mappings to the new palette (i.e. less colors)
- Dithering

So, you can give up all these features for speed, but you lose functionality. SOL draws slowly, but when you consider all it is doing in realtime, it's like comparing a cramped racing car to a luxury car.

There are great advantages to realtime processing. For one, you don't have to re-load the image everytime you change some little thing. Second, you can see your changes immediately (no lengthy precalculation). I'm thinking particularly of scaling here.

I do admit, Turbo GIF is VERY fast in decompressing, and passes Speed of Light in the record books for GIF. Just wait for version 3.7, the GIF routines have had some working over, but it will be hard to get any faster than TGIF...well done! Does TGIF use the DSP?

Well anyway, I think my basic point here, is that functionality AND speed wins over speed alone. I think this has been demonstrated with the success of that SLOW but useful GEMview. One has to consider what is going on before you compare things. Decompression is a valid comparison, but drawing is not.

I have a 520STFM (internal power supply, internal single sided disk drive) for sale. It includes the mouse.

I also have an SC1224 color monitor for sale. It's the superior JVC model.

Both items are in excellent condition.

I'd like around $50 for the ST and $75 for the monitor. Shipping will be extra.

Stuart Denman <sdenman@wolf.cs.washington.edu> wrote:
>You can't compare TGIF and MGIF to Speed of Light because when SOL draws

I think a comparison is valid, since most users probably use the programs
to simply view images. For that purpose something like TGIF is quite enough.
If on the other hand image processing is needed, I'd take MGIF any day. ;-)
Speed of Light sure does the best job for ST-low, but if we include
TGIF in the discussion, we're talking about Falcon 256 colour mode, right?

>the image, it is doing many things IN REAL TIME while it draws:
>
>- Scaling to any pixel, width and height!

I almost never use the scaling feature in MGIF (which is quite fast despite
being written in C), but I've heard from one user who'd like automatic
scaling on load. Scaling while you draw sounds like a waste of time to me.
I know you use the scaling features to do the warping at draw time, but how
often is that used anyway?

>- Converting original palette mappings to the new palette (i.e. less colors)
>- Dithering

Neither of these are very useful in 256 colour mode on a Falcon, which is
the only thing TGIF can use. MGIF can use ordered dither to display 24 bit
images in 16 or 256 colours or a 256 colour one in 16 colour mode. Naturally
this is a lot slower than drawing a GIF in 256 colour mode.

>So, you can give up all these features for speed, but you lose functionality.
>SOL draws slowly, but when you consider all it is doing in realtime, it's
>like comparing a cramped racing car to a luxury car.

In the case of MGIF you can have about the same amount of luxury and space
(although slightly different) in your F1 car by doing a short pit-stop. ;-)

>There are great advantages to realtime processing. For one, you don't have to
>re-load the image everytime you change some little thing. Second, you can
>see your changes immediately (no lengthy precalculation). I'm thinking
>particularly of scaling here.

In MGIF you can usually try out different things without reloading your
image, since it can use dual buffers. It does need twice the space, though.
As is shown in the table below, you can actually do a few reloads if you
want to, without getting worse total performance than SoL 3.5.

>I do admit, Turbo GIF is VERY fast in decompressing, and passes Speed of
>Light in the record books for GIF. Just wait for version 3.7, the GIF routines

>have had some working over, but it will be hard to get any faster than
>TGIF...well done! Does TGIF use the DSP?

The latest MGIF was about 10-15% faster than TGIF 1.2 on decoding the
640x480 GIF in the table below... :-)
Decode times were: MGIF 1.8, TGIF 2.0, SoL more than 5.

TGIF 1.2 does not use the DSP. Is TGIF 1.3 faster?

>Well anyway, I think my basic point here, is that functionality AND speed
>wins over speed alone. I think this has been demonstrated with the success

Agreed, but I don't think doing a lot of things while drawing is a good idea.
Still, as long as people register SoL you can do whatever you like. For those
who don't like or need the real-time stuff, MGIF can be had for free.
The sources to MGIF are always available to use in other FreeWare programs,
so some day they might be used in a program with the same philosophy as SoL.

If someone is working on a desktop background program, please contact me. The
GIF loading speed of the last one I tried was absolutely horrible.

>of that SLOW but useful GEMview. One has to consider what is going on
>before you compare things. Decompression is a valid comparison, but
>drawing is not.

When the drawing can be done 5-6 times faster, I think it can be compared.
Wouldn't it be nice to draw a 640x480x256 image in about 0.6 seconds? I've
not seen any other program on the Falcon come close to that. I wonder how
fast it would be on a TT...

A small table comparing the speed of TGIF 1.2, MGIF 4.4(94-08-26) and
Speed of Light 3.5 for my favourite GIFs follow below.

- All tests were run in the normal 640x480x256 VGA mode of the Falcon.
- The files were located on my Falcons internal IDE drive and were not
fragmented.
- Timings were done by me, using my wrist-watch, so they are probably not
accurate to more than 0.1-0.2 seconds.
- For TGIF the timer was started right after the start up text was written.
For MGIF and SoL when the return key was pressed in the file open dialog.
- The timer was stopped when the image was completely drawn to the screen.

Since SoL can not display the image immediately after load (AFAIK), I
pressed enter to display the image as soon as was possible. Please, feel
free to discount a second for my reaction time. ;-)

Size (bytes) Size (pixels) Time to load and display SoL TGIF MGIF
252988 602x475 17.4 4.6 3.2
197632 640x480 16.3 4.8 3.3
150528 640x400 15.4 4.1 2.9
5446 640x512 8.7 3.8 2.6

Now, if you wanted to take a look at a few GIFs, what program would you use?

Note, that all the images were displayed in 256 colour mode on the Falcon,
so all the palette trickery and dithering of SoL was unused. The pictures
looked the same on screen for all three programs.
All the sizes were such that no scaling was really needed, which is the case
with the vast majority of GIFs in my experience.

>
>Works perfectly on my Falcon without any problems at all.

I can get it to run if I don't use BlowUP030. If I start it from my normal
1008x608x16 mode, it screws everything up. The image is drawn, but it's
impossible to see what it looks like. I think it's the line width that is
mangled.
Perhaps TGIF 1.3 has fixed this problem.

>Does MGIF support colour these days then I thought it was mono only? If it

MGIF has had support for colour for about a year now, but no new versions
have been released.

>does do colour can you advise a site and directory it may be ftp'ed from?

Since there's only a beta version available right now, it's not been put on
any ftp site. I'll mail it to anyone that wants it, though.

I'm thinking of putting it on my SS20 at work. Since I want to keep track of
who's got the beta release, however, I need to find an ftp that can log
accesses. Perhaps it would be easier to set up some kind of email-site.

Please, send email if you want to try the latest mgif. There is no need
to waste bandwidth. Besides, I might forget about you otherwise.
The questions that might be of public interest are answered below. I'll mail
you about the rest shortly.

In article <33lg97$6ue@ugle.unit.no>,
Erling Henanger <erlingh@nova.pvv.unit.no> wrote:
>- so lets see how it will work with memory-protection enabled :-)

I've run mgif with virtual memory as well as under MultiTOS with memory
protection. I don't think anything important has changed since.

>You probably don't support the new iconify calls and stuff, but if you

As I said before, mgif now has a GUI with menu and dialogs. I did not mention
windows for the simple reason that there is only one (progress report) so
far. I intend to switch to the excellent gem++ library for the next version,
so I don't want too much code to rewrite.

Replying to your own message is not a Good Thing(TM), but I just realized that the thread subject of the messages by Stuart Denman and me was a tiny bit off the mark. ;-)

By the way, I took another look at SoL and found the 'display after load' switch. The timings for SoL should probably all be 0.5-1.0 seconds lower. Sorry about that.

It looks like they only have old stock, so what gives, a friend here brought
version 3.0hi some 10 months ago from the UK....

I have tried that e-mail address, it looks like they only log on there
every month, I never got a reply...??

I remember reading (and voting) for a new newsgroup some months back, I believe was to be called 'Comp.sys.atari.announce'. Well, now when I attempt to access this newsgroup, I can't find it.

Am I using the wrong name? Thanks!

Its probably around $100... all come with O/S in rom these days, although
most users replace the gui with a desktop replacement.

If your looking to move into the market, I'd reccommend at least an ST*e*.
probably the same price if you look hard enough, and a cool little machine!

It was none other than Mickey Boyd that wrote on 24 Aug 94 that ,
MB> Flight Simulator II is probably the most technically accurate flight
MB> sim available for the ST (for small unarmed aircraft, at least :-).

A320 Airbus is a much more recent addition and IMHO more accurate sim.
Heaviest box i've ever purchased BTW ,possibly because of they give you
genuine pilots navigation/beacon maps with it along with loads of techy stuff
.... for 'serious pilots types' only though ,this is one mean beast to land on
manual :-)

MB> numerous data disks for it (even an adventure game of sorts, where
MB> one flys over "clues" to the next destination - this is on the Hawaii
MB> data disk I believe). Hope that helps.

A320 is(or was until recently) still being supported on the Atari ,with a
recent US addition to the European original.

>
>I believe that Protext (no idea what version) can also import the RTF format.

Other wordprocessors that support RTF are Papyrus, Script 3.5, and Tempus Word,
though papyrus has the most complete one (that's not only my opinion :-).
None supports tables or pictures AFAIK, and only Papyrus handles font sizes right.
However, no guarantees for importing into MS WOrd (exporting from it works usually
fine since it's mostly the readers responsibility). When I tried importing into MS
WOrd 5 on a Mac, it screwed up Umlauts and most of the paragraph formatting,
though the RTF (exported from Papyrus) is correcty imported by other programs.
Considering Microsaft invented RTF... I guess it's another marketing decision
to implement RTF badly, for if it worked well, people might actually start using
other WP's.

: >redundancy and ease of access I think it is worth every penny.

: There are plenty of quality PD Atari files that AREN'T on the net. And
: as it stands now, there is not enough room for them on all the archives.

: You've missed the point. Is there a need for every site to have their
: own personal copies of the files? Absolutely not. A filesystem like AFS
: or NFS would be just as effective and save a great deal of space on the
: net.

: Sure, space is cheap, but let's use our space wisely. As a good friend
: of mine says, "There is only one kind of drive: too small."

I think you are missing my point, the problem is not space, we both
agree that is cheap. The problem is bandwidth, with WWW trafic and so
on going through the roof there is a need to minimise the distance
data has to travel. It is well known that the trans atlantic fat pipe
and other links just arn't fat enough. I bet the entire of a.a.u.e
would fit on <1 gig so having 9 copies arround the world would cost
$3,500 but saves tens of thousands in network traffic and machine
load. You seem to assume that because here in the US there is a great
DARPA funded network backbone that is true for the rest of the world,
this is not true.

Dave.

I don't know about a 1040ST w/o the O.S., but most computer stores I've
talked to sell the 1040STfm (internal DSDD drive, TOS 1.02) for about
$140-$160. Add about $70-$100 for a used monitor. On the open market, of
course, the 1040 I describe can be had for about $120 (maybe with some
software), or possibly less.

>If your looking to move into the market, I'd reccommend at least an ST*e*.

I agree with this. A MegaSTE or better yet a TT030 or Falcon030 would be
even better, but then they're also a lot more. :-)

2949. UMAX scanners on TT - has anyone tried it?

Newsgroup: comp.sys.atari.st
Date: 1994-08-28 12:35:40 UTC
From: jonal@dhhalden.no
Message-ID: <jonal.2552.2E60849C@dhhalden.no>
Source record: 181486

I am looking to buy a scanner for my TT and the first thought was to get a Microtek II scanner, since this has support via the MT-Scan package or one of the HP ScanJet II series of scanners which have excellent (or so I've heard) support from most German packages (I am waiting for DA's Picture to arrive). Now, I got a good offer on an UMAX scanner which is superior to the Microtek I was looking into, but I don't know if it's supported or not by DA's Picture or any other piece of software.

If anyone knows, could you please drop me a line?

Best,

Jon

Sorry, that's totally wrong. Notator Logic Audio does run on the Mac,
but requires extra hardware for direct-disk recording. Trust me, I'm
looking at the brochure in front of me. I quote, "Logic Audio (Mac)
is also the first digital audio sequencer to support Digidesign's Session 8
hard disk recording system for the Macintosh, including full automation
(EQ, Volume, Panning and more) of all 8 digital audio tracks". Also,
"All of Digidesign's Mac-based recording systems - from Audiomedia II up
to ProTools - are completely compatible with Logic Audio and the Digital
Factory, giving you up to 16 simultaneous digital audio tracks within the
sequencing program, in addition to Logic's outstanding MIDI capabilities."
It also works with the Alesis ADAT recorder.

So, check your info before you post.

Not sure if this is what the original poster was asking about, but if you're using a Roland S-10 to take samples and want them transferred to an ST(e) via the MIDI ports, Anthony Watson of Mountain Software has written a program to do it that is quite friendly and easy to use. It's called S-10 Converter, and I think it is freeware. If it isn't already, I'll see if I can get it uploaded to a.a.u.e. and any other sites I can think of, or you can get it on Genie (S10?????.??? or S_10?????.???) or by emailing Mr. Watson at a.watson6@genie.geis.com.

2956. NeST & AtariNet Piracy??

DB> Shortly you may see mail posted from Rickard Troedsson concerning software
DB> accusations of rife piracy going on in NeST and AtariNet.

After this message Daron, I do not have to post that list. You have clearly showed yourself here that you are VERY afraid of seing logfiles from the old Sarcastic Existence - where you downloaded no less than 40 commercial pieces of software in two days, posted here.

If AtariNet cared, you wouldn't be able to put "AtariNet Europe" in your .sig. That NeST doesn't care we all know - you are the creator and supervisor.

I have no reason to continue this, from the biginning PRIVATE, discussion in this newsgroup, and I want everyone to know that it was brought up here by Daron Brewood.

(As for the list, they know who they are. I would advice them to stop their activities if they want to be able to continue using their Atari. Myself I've switched to the PC-platform, which is *VASTLY* superiour to the Atari.)

The Chameleon v1.19 by K.Isakovic does indeed allow you to load and unload any one accessory at a time. To unload an accessory (it has a little arrow pointing at it), just hold down <Alt>+<Shift> while clicking on the desk accessory (in the "Desk" menu). Some few accessories won't unload, and a even fewer will cause the system to crash (I've noticed this with CLI ACC's). This won't harm your system, however. You can even run more than one Chameleon at a time (just make a copy of Chameleon with a slightly different name), and while one chameleon takes about 5kb, the others will take less, since they share memory. There is also a customization program for Chameleon (CHMLCUST.PRG, or something) which you should be able to find online. I don't remember what it does, but it might have to do with running more than one chameleon at a time.

Just experiment with it to see what works and what doesn't; you're not likely to do any damage.

Regards,
Tom

>accelerates DSP and FPU as well, if so wanted. It seems to be a high-end
>graphics enhancer, too (even better than Blow-Up, SB2, etc. ?): e.g. 1024 x 768
>/ 70 hz NI, 800x600x256 70 hz, and so on.
>This little miracle isn't expensive at all - but does it really WORK..?

I recently installed a 40 MHz upgrade kit into a Falcon of a friend of
mine, the manual stated that the producers installed the set in many
Falcons without problems but there was a slight chance it wouldn't work as
they could not guarantee the processor keeping up with 40 MHz..
Well, in my case it could not, The machine refused to boot up after
carefull installing the three black boxes. The manual stated if the set
didn't work you could send it back and get a 32 MHz version which should
work always. After examening the black boxes one of them proved to be a 40
MHz oscillator and I removed this one and connected the wire which went out
of this box (carrying the 40 MHz clock signal) to the 32 MHz oscillator of
the DSP and voila, the Falcon ran fine at 32 MHz. Further examening proved
that the modification box for the serial chips (keyboard and Midi) didn't
need the box as it only suppiled those chips with a steady 8 MHz and by
using 32 MHz as master clock, the original lines could be used so I
resoldered the disconnected pins back to the circuit board. By going back
to 32 MHz the Blow-Up part doesn't work anymore so no improved graphics..
The machine is now running for a couple of weeks without problems, no extra
heat seems to be generated so I suspect Atari was just going on the safe
side by using only 16 MHz, the processor is handling it well..

>3) Why doesn't CONNER 340 MB SCSI-drive (new model) autoboot connected to
>Falcon..? A friend of mine wonders that; his previous Quantum LPS 105 worked
>without problems... Otherwise everything OK - but no autoboot, no matter how
>he formats the drive. HDX and ICD Pro Tools have been tested - but I
>personally suspect that there is a hardware problem in new Conner drives
>(connected to Ataris..) ? That's because I myself couldn't get a Conner 1.3 GB
>drive to work reliably with Atari TT (Hewlett Packard finally did the job..).
>So, what's the problem with Conners? Parity? Any help possible?

Maybe the drive is a SCSI-2 and the Falcon's bus only looks like a SCSI-2 but in fact is just SCSI-1. The drive will start up in SCSI-2 mode and doesn't properly respond to the Falcon's boot commands. It probably switches to SCSI-1 after getting the commands but then it's already too late... Solution ? Mount a small 2,5" IDE drive internal and use it for booting up..... :-)

>4) You who have "real" accelerators (w. Fast-RAM, 68040, etc..): will there be
>compatibility problems? How about games (e.g. does Backwards quit working?) ?

After installing the kit, the Falcon can be switched back to it's native 16 MHz with a switch. But only if the 32 MHz kit is mounted, after installing the 40 MHz version, you can not even use ordinary monitors any more !! By speeding up the video system, all frequencies are 'upgraded', TV's and old RGB monitors can be going up in smoke!!! Even VGA monitors aren't safe to use anymore, only SVGA and multisyncs, all of this is not mentioned in the advertisings, but the first page of the manual warns about it...

If you would like to speed up your Falcon go for the 32 MHz kit, performance is almost up to TT speed, only memory access is still a little slower (no FAST RAM).

>5) Geoff Crammond somewhere: please, make a ST/Falcon (!) conversion of your
>forthcoming Formula One Grand Prix 2 simulation..! ;-)

And for the TT of course... :-)

My goodness, that's 122 centimeters !!! This hardly can be a picture tube
is it ?

>1) How good would it be as a monitor for a Jaguar or Falcon?
> i.e. would there be any way to go beyond 640 * 400 interlaced on it,
> because that would be awfully foul indeed on such a screen (for work,
> of course $-)).

If you have bad eye sight it probably is usable :-)
You will have to get the specs of this beast and check if it can handle 15
kHz Horizontal and 50/60 Hz Vertical sync.

>2) Just because it doesn't have a Tuner, I could still use it as a Television
> via RGB cables from my VCR / Cable Box....right?

You can use it as a TV only if it can handle the above freqencies, then
you will need a Composite Video (CVBS) to RGB converter too, most VCR and
TV's don't have RGB output.

>So should I get it? What kind of adaptor would I have to put together to
>get it to run with a Falcon (it uses 3 seperate R/G/B in ports, I believe).

If it has 3 (probably 5) separate inputs, you will have to construct a cable
(or buy a 17"/21" monitor cable) that has seperated outputs for all these
signals, all signals ARE available at the monitor output, so it could be
possible.

For $199 you can always turn it into a very large aquarium... (for expensive
tropical fish...)

Good luck,

Gert

Reading a few days back here, someone posted a message saying that they had a copy of Atari's Shareholders meeting results.
They stated that Atari had ceased production of their computer line and would not be producing any further computers than the Jaguar product.

You are probably referring to my posting. (Did you get your facts straight?) I QUOTED the annual report. You are correct. It did not say Atari had ceased production of the Falcon and neither did I.

It used words about the Falcon such as sales "not expected to be material in the future" It also said they had written off the ST and TT due to being "technologically obsolete." (And as one follow up said, it would sure be nice to have some of that obsolesence!)

I am a long time dedicated Atari owner and have no plans to replace or get rid of my very useful STe, but I do not have a good feeling about the future of the >current< Atari line of computers. I almost bought a Falcon but know that Don Bahr of Compu-Seller West (Chicagoland) has been flooded out of existence, that is unlikely. Of course, I wouldn't mind being proven wrong... :-)

Gee Wiz, Johan, I wasn't attacking MGIF, so why do you attack SOL?

Those times you gave were not fair because they make things look bad for this reason...SOL must go through many processes to do the different things it does. Without these processes, you cannot do all this stuff. Drawing the image in SOL takes a lot of time. Sure I could just blit the thing directly from decompression buffers to the screen and get your 3.5 seconds, but then you couldn't do ANYTHING with the image! Maybe you just "view" images everytime, but I think most users (I know a lot who do) like to scale the images while they are viewing them to get exactly what they want.

I'll let users choose. Also, you didn't compare speeds on NOVA cards, etc, only Falcon 256 color modes. What about ST-Low? SOL draws about 1000% faster on the Nova cards than on Atari video modes. Does MGIF even work on the NOVA cards? Anyway, I hate arguing about this stuff, so just forget it Johan.

I just downloaded MGIF from ftp.cs.ruu.nl and did some tests. This was a 640x480x256 GIF image. I timed how long it took from loading to drawing end. This was on a Falcon030 in monochrome using flickering to increase the "shades." This is with SOL 3.7 (working in monochrome.)

SOL: MGIF:
9 sec 38 sec

What's the deal with this? Both are dithering and flickering?
I figure this is because MGIF did some processing before displaying the image. In Falcon 256 it sounds like MGIF doesn't do ANY processing (like you said, it isn't needed!?!?) but SOL does LOTS of processing. It just depends on what you like. If you like a scaled-down viewer, go with MGIF. If you want features and flexibility, go with SOL or GEMview.

bye,

Stuart

2968. MX15F monitor troubles...

Newsgroup: comp.sys.atari.st
Date: 1994-08-29 06:32:36 UTC
From: jbaumgar@bronze.coil.com
Message-ID: <33rve4$hoj@bronze.coil.com>
Source record: 181405
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a rather strange problem with my Mag Innovision MX15F monitor.
My display likes to slowly drift to the left, one pixel at a time, until
it finally reaches as far as the monitor will go. It appears as if it is
actually affecting the buttons on the front, because the monitor acts as
if H-PHASE (5) had actually been pressed.

There are two ways to fix this problem: 1) phase the display completely
to the left and then correct it with BLOWUP. This creates an undesirable
output. 2) keep the h-size (7) at a bare minimum. This takes about 2"
off of my 15" monitor, another undesirable thing.

Anyone have any ideas what's causing this, or does anyone have the number
of Mag Innovision so I could call them? It's not in the manual.

Thanks!

Ok I am having trouble getting Gemar (the tape backup program) to work with Chameleon (the accessory loader).

When Chameleon is resident Gemar does not display any text either in the shareware message screen or the directory listing screens (which is much more of a problem). A secondry problem is that Gemar bombs with two boms on exit when Chameleon is present.

I find this very odd since I have never had any trouble with chameleon in the past. Does anyone have any ideas? I am using a Mega ST, Tos 1.4

Thanks,

Dave.

2971. Tape Backup SW

I am still having trouble finding a reliable way to use my new tape drive. Gemar seems not to get along with my setup and I can't work out how to get the tapebios/gtar combination to read or write to my tape (even though tapetest works fine.) gtar seems to expect a /dev/mnt which of course does not exist under standard Tos.

What do fellow netters think of Diamond Back? Can it perform the following:

o Backup non tos partitions (Mac GCR for now minix in the future.)?
o Can it read/write unix tar files that my sun at work can read/write?
o Can it perform incremental dumps and tars?
o Can it undertand my Wangtek 5150ES drive?

If so how much does it cost? And is there a demo on the net?

Thanks,

Dave.

Stuart Denman <sdenman@wolf.cs.washington.edu> wrote:
>Gee Wiz, Johan, I wasn't attacking MGIF, so why do you attack SOL?

I'm sorry if you took my message as an attack on SoL. That was certainly
not my intention. SoL is a good program.
I hope this article won't look like an attack, but I feel I have to
comment on a few things.

For the record: For ST-low SoL is the better program. No contest.

>Those times you gave were not fair because they make things look bad for this
>reason...SOL must go through many processes to do the different things it does.

Yes, but in the case that message discussed (Falcon 640x480x256 mode), all
that processing is often unnecessary.

>Without these processes, you cannot do all this stuff. Drawing the image
>in SOL takes a lot of time. Sure I could just blit the thing directly from

My point was that they can be done at another time than the actual drawing
without much inconvenience in most cases. If they're needed at all.
It would of course be easy to do it this way in SoL as well, but if your
users don't want it, they don't.

>decompression buffers to the screen and get your 3.5 seconds, but then you

Well, you won't actually. It's not exactly easy to convert from the byte per
pixel format used in GIFs to the Falcons bit plane mode that fast. TGIF 1.2
does it in almost the same way as SoL and as can be seen in the timing table,
it's a lot slower.

>couldn't do ANYTHING with the image! Maybe you just "view" images everytime,
>but I think most users (I know a lot who do) like to scale the images
>while they are viewing them to get exactly what they want.

I almost never "just view" images. In fact I almost never load GIFs. What
I want is image processing power. Of that, I have more than I need in MGIF.
Regarding scaling, I've never had any requests for scaling on draw for MGIF,
but I'd add it if anyone wanted it. It would be very easy to add since the
bresenham routine for the size changes has been used for the 'off line'
scalings for more than a year. Of course it would draw a little slower, but
I'd keep the old routines as well.

>I'll let users choose. Also, you didn't compare speeds on NOVA cards, etc,

Of course the users may choose. Since MGIF is FreeWare, I can add what I want
and if noone else likes it, I'll still use it. The sources are avilable if

someone wants something I'm not willing to add. In fact I've had requests to add the kind of colour flickering you use in SoL, but I've decided not to implement that. It simply doesn't fit with what I like MGIF to be.

I'd like to get MGIF to run on all kinds of graphics cards. Unfortunately I don't know anyone who've got one. It's a bit hard to do testing by sending a lot of program updates over the net. If there is anyone would like to help out, I'm all ears.

>only Falcon 256 color modes. What about ST-Low? SOL draws about 1000% faster

I only talked about Falcon 256 colour mode in that article because of your reference to TGIF. TGIF can only use that mode.
I'd be the first to agree that SoL displays images a lot better than MGIF in ST-low.

>on the Nova cards than on Atari video modes. Does MGIF even work on the NOVA

If the NOVA cards uses chunky pixels, MGIF does not work. It might work on some graphics cards that uses the normal ST planar mode.

>cards? Anyway, I hate arguing about this stuff, so just forget it Johan.

Well, I'd like to see it as a discussion rather than an argument. But if it's only you and I who add anything to it, I guess email is better. We could of course drop it altogether, but I for one would like to know what people think about this.

If there is anyone else who has any views on the subject, please speek up.

Oh well, I guess I have to write a follow up to this as well.

>640x480x256 GIF image. I timed how long it took from loading to drawing
>end. This was on a Falcon030 in monochrome using flickering to increase
>the "shades." This is with SOL 3.7 (working in monochrome.)

I'm sure there are a lot of people who'll be happy to hear you've added
support for flicker in monochrome. How many images are you flickering?

>SOL: MGIF:
>9 sec 38 sec
>What's the deal with this? Both are dithering and flickering?

I get your point. Start of load to finished draw time was the same thing I
did in my timing table.
You "forget", though, that the case I timed, the displayed pictures were
identical (640x480x256 all colours used, no dithering, no scaling), which
they're not in this case.

If you've not done any drastical changes, SoL drew that picture with an
ordered dither matrix, right? MGIF uses Floyd-Steinberg dithering, which is
a lot slower. Did you see the quick preview image that appeared before the
F-S dithering began? That is almost directly comparable to your dither, the
only difference being that you use flicker, apparently.
I don't think an ordered dither can be done much faster than the way I use,
but of course it would be a couple of times slower if it had to draw three
screens for flicker.

By the way, MGIF 4.4 would be quite a bit faster at that example, since the
GIF loader and flicker drawing were the first things I improved in v4.3.
The following is the first three lines of 4.3 part of the MGIF history file:

* 93/07/07 4.3 Klockars - GIF decoding speeded up very much
* - more speedup due to better interlace handling
* - drawing speedup by doing F-S line by line

I don't really remember how much faster it got, but perhaps you'd like to
post the timings for MGIF 4.4? If you do, include the quick draw timing.

>I figure this is because MGIF did some processing before displaying the image.

Well, I think it does calculate a histogram, for historical reasons, but that
is all. The rest is due to the F-S dither (and the version of course). The
preview picture appeared a lot quicker, right?

>In Falcon 256 it sounds like MGIF doesn't do ANY processing (like you said,
>it isn't needed!?!?) but SOL does LOTS of processing. It just depends on

When displaying a 640x480x256 colour picture in a 640x480x256 colour mode,
I'd say you don't need to do much processing. You could scale the picture,
median filter it etc if you liked to with MGIF, but not while drawing.
What kind of processing do you think is useful in this case?

>what you like. If you like a scaled-down viewer, go with MGIF. If you want

Huh, MGIF _scaled down_? It has all the features I want, which I can't say of
anything else I've seen. If I did a GIF viewer version of MGIF it would be
more like 10-20kb than the 200+kb it is now.
The GIF load and 16/256 colour draw code are a _very_ small fraction of MGIF.
Around 400-500kb of C sources (excluding the JPEG library) do a bit more
than that! Especially since I usually don't write many comments. :-(

>features and flexibility, go with SOL or GEMview.

For flexibility maybe, but it depends on what you mean by that.

As for features:
- Can those programs do median filtering.
- Can they do general convolutions (for example the ever popular
'stone carving' effect, edge enhancement and edge detection).
- Can they do logarithmic scaling of pixel values?
- Can they process images in 24 bit colour and display them in 16/256/65536
colours?
- Can they display in Falcon true colour mode using F-S dithering?

I couldn't find any of those features in either, last time I looked.

Of course it is possible that they have features that the users want, that
are missing from MGIF, but then I'd like to hear about it.
That's why I reply to these posts.

Source record: 181424

Hi Folks,
i have following problem:

Running MiNT 0.98 (?) on a STE with 4 MB I have installed gcc 2.5.8 and more.
In a program I am using the curses library.
Now: Each call of a scanw function doesn't work. The program doesn't crash, but
the variable in which scanw should storage the input value is empty.

Do I have an old patch level of the curses library or is there a chance on
using a "special" curses call?

Thganx in advance,

Klaus Brand.

I've got an FPU in mine, but I'm almost positive it worked just as "well"
before.

KN> The Mac Notator is called Notator Logic, and I think it's also
KN> available for Falcon and maybe even ST. It was done first on
KN> Mac, and is not really an upgrade, but a total rewrite. It is
KN> a lot larger, more sophisticated, more expensive, and slower.
KN> (It would probably be unusable on a normal ST).

On Logic's being "unusable" on an ST - I've got an STe, and am beginning to use Logic with it. Although the display will slow down with certain functions, I'm finding it certainly very usable with my machine. (Though to be fair, an EMagic spokesperson said they recommend running it on at least a MegaSTe with Warp9 installed). It will run on a 1-meg ST, but EMagic definitely recommends having at least two megs and over to properly make use of it.

One of the funny things about it, though - I've seen it running on a fairly sophisticated Mac system, and it seemed even slower than what I'm running on my STe.

The current version of Logic runs at version 2, just released - it fixes a large number of bugs in the original program , and adds a number of incredible features, including the ability to print out your notation in guitar tablature. This is the version you should go for if you decide to convert. Happily, it will also load your old .SON format files from Creator or Notator and convert them to the new .LOG format; you also have the option of saving them as an SMF1 .MID file for exporting to other platforms. Also happily, EMagic offers a fairly liberal upgrade policy from older versions of Notator/Creator, even if you're switching platforms. (I upgraded to Logic from Notator Alpha last March for $299 Canadian & GST/PST - well worth it, the original upgrade was around $500; and I got a new version of Notator SL which runs with the new dongle/interface with it.)

KN> This is definitely pro high-end stuff, way beyond what most
KN> amateurs need IMO

Depends on the level of the amateur :)

Seriously, if you don't mind spending a little more time on the learning curve, Logic is definitely worth the extra trouble - I've been able to configure my MIDI system together in ways one wouldn't think possible, including setting aside specific MIDI channels for specific module instruments (you can set it up so it will automatically call up a specific piano patch from, let's say, a SoundCanvas, complete with volume levels and velocity curves). And having some neat built-in effects - like the delay line and

arpeggiator.

True, it may not be for everybody. But I enjoy having something that offers me a challenge. It'd be incredible, though, if they DID come up with a simpler version for Atari users that included some of the power for a lower price for the basic hobbyist. To be truthful, I'm hoping to put together an album of my original tunes (and some wacky re-arranged covers) someday, and if I have to go into a professional studio I wish to be covered for any eventuality.

KN> Logic is put out by Emagic, which I think is owned by Ensoniq.
KN> That's where all the programmers from C-Lab went when it broke
KN> up or whatever.

EMagic is its own company, owned by the original programmers of Notator - Ensoniq is the US distributor of its product, much in the same way that Musicware is the Canadian distributor of EMagic products. And C-Lab is apparently very much alive; word is from the last Atari stockholder's meeting that they're being given the green light to design and manufacture a MIDI workstation based around a Falcon 030 clone. Interesting news, and if they do go through with it it'll be an interesting new bit of weaponry for those of us in the Atari trenches :)

Hahahaha... No, but they _do_ develop a rather sick, intimate relationship
with AUTOEXEC.BAT, CONFIG.SYS and WIN.INI not to mention the mandatory use
of some third party memory manager.

"I'm sorry, sir. It doesn't matter if your PC has 64Mb of RAM,
your system's primary memory is still limited to only 640K!"

Fer sure... that's the kind of modern machine I want. Yeh, right. ;-)

'Chicago' will be a lot better, though. It can crash TWICE as fast!

>Hi folks,

>I'm trying to find an ST word processor program that can read and write MS
>Word files. Is there such a thing and what is it called.

Le Redacteur (versions 3 and 4 as well as the recent Le Redacteur +) can all
read and write MS Word files. The files are in Word for DOS format and appear
to be somewhat rudimentary to me as an end-user. I can assure you that files
can be exchanged both ways but don't expect full compatibility with WinWord 6.0

Note 1:

Le Redacteur is a french word processor from ETILDE. I know that it
also exists in English but getting hold of it in the USA might be difficult.
If you wish, I can forward the ETILDE address in Toulouse.

Note 2:

Le Redacteur requires (in my opinion) a hard disk and at least 2 MB of RAM to
run in an acceptable way. I've used it on my 1040 STFm with two floppies:
this is just about feasible but not exactly comfortable.

Good luck !

>
>Thanks!
>

Hi Jim!

I have the MAG 17" MX17S Innovision, and there are no such problems with
it. I'm using Screenwonder Pro as a resolution enchancer.

If this shifting does NOT happen when BLOWUP is inactive, then replace
your software (the BLOWUP is capable of doing such harm - my Screen-
Wonder Pro started once to alter Fine Hor. Sync. setting on it's own
and the only way to get rid of it was to re-install the whole software).

If is not the the BLOWUP's fault, then I advice you to go to the shop
where you bought it and get the button electronics or membranes
replaced.

Do NOT open the monitor as it has very strong currents inside even it
is unplugged.

Hope you get it fixed!

Well, it's the season for Atari problems around here! I just recieved a call from my father who described the following problem to me;

He turned on my Sister's 520stf (2.5megs ram), and instead of the normal sreen what came up was (and I quote;-) "something that looked like a TV with bad vertical hold! So, he turned everything off, and then checked the connections, and now nothing comes on, not even the little green light. However, he says he can still hear a 'slight humm' from the monitor... I just used this monitor myself last night...

So, he tried the Color monitor, and *lo, it haseth the the same vertical problem*;

Is the ST powdered toast?
Did my sister spill coke it in?
Can Lassie save the day once again?
Or is this finally the end?

Tune in next week for the chilling conclusion!

(Any advice would be greatly appreciated!)

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's 'Statistics of Deadly Quarrels'. You've probably never heard of it even though its relevance to the mess you're in is at least as great as that of Darwin's 'On the Origin of Species,' which you learned about in fourth grade. And that's because it's so completely terrifying only those 'experts' who are adequately armoured with preconceived contrary ideas which will enable them to disregard Richardson's work completely ever get to study it."

2995. cps rates

Newsgroup: comp.sys.atari.st
Date: 1994-08-29 20:32:58 UTC
From: Martin.Stacey@255-80-1.centron.com
Message-ID: <2d7_9409011747@centron.com>
Source record: 181225

replies please to mas@walusoft.centron.com

Can anybody suggest a helpfull solution to the following problem I am having ?

During my normal mail sessions to collect/deliver network mail and files with 28800 connects all goes well with frequent cps rates > 3000 in both directions.

BUT

If a user logs onto the BBS at 28800 whilst he can upload for example an asci file with an average cps rate >3700, when the same user tries to download exactly the same file the cps rate seems to reach 1700-1800 CPS and never any higher using Zmodem in both cases. Users have tried both with xyz202b.ttp and gszrz installed at the BBS end without any significant change in results.

I run the BBS on a...

4MB STFM TOS2.06 on T board (rainbow TOS is original) fitted with a T28 Mhz accelerator and a serial port modded with the CD4040 chip mod.

BBS Software used is
Tomshell
Semper V0.60
QBBS V1.12
XYZ202B.TTP although I have also tried gszrz

Any hints tips or suggestions please.

2996. ***ICD HARD DRIVE PROBLEM*** HELP PLEASE!

Newsgroup: comp.sys.atari.st
Date: 1994-08-29 20:33:37 UTC
From: peterw@io.org
Message-ID: <33tgn1$dd2@ionews.io.org>
Source record: 181438

I seem to have run into a problem with my ICD hardrive. I've got a 128 meg Quantum ELS127S installed and had it partioned into two equal partitions. It seemed to run fine for about 5-6 months, but NOW I've started getting these "data on drive E (F) may be damaged" messages along with the following appearing in the top right corner of my screen:
<Sense $7F>
I've tried re-formatting the drive using the ICD utilities disk. I'm not sure if it's working 'cause it only says "FORMATTING" on the screen for a few seconds and then goes into a GEM type screen without any pull-down menues or anything and the "bee" turns into an "arrow" so I imagine the formatting was a success (or was it?). Anyhow, the problem still exists no matter what configuration I partition it with (1,2,3,4 etc.)
Luckily there's also another smaller hard disk in the "FAST" ICD box that I've been using as a boot disk and I've been able to move the important files over to. Unfortunately I've got this 128 meg unit that's been rendered useless.
ANY SUGGESTIONS WOULD BE GREATLY APPRECIATED.

I'll put your message up as E-Mail on our BBS and give him
a phone call besides. Just to make sure he collects his mail promptly!
I'll get back to you as soon as I hear back from him! Only
only thing is I am going to be out of town till Thursday night.
Might be as late as Friday till I can get you an answer!

As you can see your E-Mail address bounced! Send me another message
and include a correct E-Mail address. I'll use that instead of just
replying via mailer.

>the Falcon is 32bit RAM and graphic card expansions ...both of which cost a
>bloomin fortune !

For general purpose usage, the Falcon may beat the TT, but the TT is still
a very good machine in its own right. Also by the time you've upgraded to
32Mhz, recased the Falcon to give a seperate keyboard, added extra serial
ports etc, then the Falcon isn't really that much cheaper. If you are
prepared to buy second hand, then a TT can be *very* cost efective against
a Falcon, provided of course you are after a powerful number cruncher, and
aren't too worried about lots of pretty colours at high resolutions.

:-)

I think i recall you saying the same about the Falcon.
It seems to me you're not just out to get NeST and AtariNet but the hole
atari market itself. In that case i really do understand why you got your
self a PC.

Just last week my bbs's drive started doing this, intermittently... I think
it means that your HD Mech. is on its way to the bitbucket in the sky :(

I've got all my file areas wiped (60meg) and had to salvage stuff as best
I could before it totally freaked - it still works on my 'other' computer
where I can put up with the <SENSE> errors etc. but my board is stuffed on
an old Atari 20meg hehehe, ack!

From: mabdul@viking.dvc.edu
Message-ID: <33u8ep$4ms@viking.dvc.edu>
Source record: 181450

Sander Stoks asked:

How do I upgrade from Turbo C to Pure C.

In the USA you can contact Gribnif Software and ask them for an upgrade.
If you're outside the US (and I gather from your address you are), call up
ASH and ask them for your local distributor.

Also, if anyone else out there knows about the status of Pure C could you
enlighten us. Thanks.

As far as I know, there is another version due by year end that will not have
any Borland copyrights on it.. I have not been informed about features, just
the forementioned.

Johan Klockars (d8klojo@dtek.chalmers.se) wrote:

: >SOL: MGIF:
: >9 sec 38 sec

: You "forget", though, that the case I timed, the displayed pictures were
: identical (640x480x256 all colours used, no dithering, no scaling), which
: they're not in this case.

B.S! The image was EXACTLY the same in both cases! Both had no scaling, etc.

: What kind of processing do you think is useful in this case?

Well, for one thing, in SOL, you can have an arbitrary colormap, so SOL goes through a complicated color matching routine. In 16 colors, it also has to reduce the colormap down, then match it. SOL also goes through post-processing palette optimization, eliminating palette entries that are un-used or are duplicated in the palette (this optimizes GIFs for saving out in less bytes if they reduce down small enough.) But the bulk of the time is taken up in drawing which maps the pixel color in the original image to the one on the screen. If I don't do this, you can't have arbitrary color maps. I like having the ability to alter colormaps easily in realtime, I suppose if I wanted to just view the image fast, I could use TGIF/MGIF without this ability.

In reference to GEMview and SOL:
: As for features:
: - Can those programs do median filtering.

No, because they use Octree and Statistical methods. These are more accurate methods than your median method (discounted by scholars!)

: - Can they do general convolutions (for example the ever popular
: 'stone carving' effect, edge enhancement and edge detection).

Not exactly, but Speed of Light has the incredibly powerful Filtering effects for 3D pixels, smooth reduction/enlargement, sharpening, and other effects. Does MGIF do Filtered Image Scaling?

: - Can they do logarithmic scaling of pixel values?

YES! In fact, Speed of Light is EVEN BETTER with its customized color tranformations. The histogram editor allows for ANY type of pixel scaling. Contrast/Washout,Log Scale,Gamma Correction, Inversion, the LIST GOES ON!

: - Can they process images in 24 bit colour and display them in 16/256/65536
: colours?

GEMview can, and SOL does this quite nicely, too! It easily handles truecolor images and reduces them down to 16/256 colors. No truecolor display yet, but you don't really need it since the 256 color display is so good. Besides, on a Falcon, I find Truecolor modes unbearably SLOW!

: - Can they display in Falcon true colour mode using F-S dithering?

GEMview can, always has!

: I couldn't find any of those features in either, last time I looked.

LOOK AGAIN!

Lets not list all the features, or we'd go on forever! There are many features in Speed of Light and GEMView that MGIF is INCAPABLE OF!

This discussion is just become a frickin' advertisement!

3010. FS: Atari Master Tracks Pro sequencer

Newsgroup: comp.sys.atari.st
Date: 1994-08-30 06:30:22 UTC
From: mcwilliams@wmich.edu
Message-ID: <1994Aug30.023022.20952@wmichgw>
Source record: 181317

Master Tracks Pro sequencer for the Atari ST. Will run on TOS 1.0 and
up. 64 tracks, linear, has song overview window, piano edit window, controller
data edit windows, Instrument list window (like a track sheet).
This sequencer is very clean, straightforward, and easy to learn. It's
great because the user interface is so easy to get used to and should please
beginners, most mid-level and advanced sequencer gurus. (Ok, so it's not
Cubase or Logic).
Complete with manual. Paid $300 a couple of years ago, asking $75
(includes shipping & COD cost).

Please reply to MCWILLIAMS@WMICH.EDU

3011. Connecting a second Harddisk

From: tletsch@sky.itr.ch
Message-ID: <33ul7l$l61@sky.itr.ch>
Source record: 181308

I got an old SH205 harddisk, which I would like to use just as a backup-device
for the orginal SH205 on my Mega ST 4.

- How do I have to set the DIP switches on both of the harddisks.
- Is it possible to to connect the second harddisk to the first, partitioning
the second and than on the desktop just announce some new drives.
(The point is, that I don't want anything to change, reinstall etc. on the
first harddisk.)

I would appreciate any pointers.

Thanks in advance,
Thomas tletsch@itr.ch

Hi Dave,

DH>I am still having trouble finding a reliable way to use my new tape
DH>drive. Gemar seems not to get along with my setup
What's the problem?

Teh WANGTEK 5150 should work with GEMAR fine, and I do not know of any
problems with GEMAR and several setups.

So, which version of GEMAR do you use (2.20 and 2.21 at the moment) and
what happens using GEMAR?

Bye, Steffen

3020. The Truth about MGIF 4.4 WAS: GIF & JPEG Viewers

Newsgroup: comp.sys.atari.st
Date: 1994-08-30 09:15:37 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <CvCCEH.F16@beaver.cs.washington.edu>
Source record: 181316

OK, I've looked over MGIF 4.4 beta, and here's what I think (as discussed before, MGIF vs. Speed of Light, GEMview, etc.) Comments on MGIF's features with comparison of SOL to MGIF.

- All items under the "point" menu can be EASILY done with the histogram editor in SOL 3.x. Contrast, inverse, brighten, darken, log, threshold, etc. Everthing! PLUS, SOL's histogram editor is much more customizable and flexible. You aren't fixed to specific features like in MGIF.

- Still NOT GOOD COLOR SUPPORT! Sure, you can load in 256 color GIFs and display them on your 256 color falcon, but if you want to use any of the image processing features, you have to switch to greyscale, otherwise you get a garbled grey output (with color). If you switch to 24 bit, only a small number of the features work in color. Most produce a greyscale output and can take up to a minute for a small 640x400x256 GIF on a 16Mhz Falcon030. None of the functions seem to work with mapped images! Now you see why Speed of Light does all that processing...it's for handling mapped images with all it's features! MGIF can't even do this, so why compare them, Johan?

- I could only get the thing to zoom *2 or /2. There is a scale feature, but if your image goes off the screen...tough luck. There is no scrolling so you can't see the rest of the image!

- Rotation is nice, can do it in integral degrees. I personally would never use anything but 90 deg. anyway.

- Sheer? How boring. Warping in SOL is incredibly more powerful!

- Oil effect is cool. Blur can be easily done in SOL by scaling any Standard filter in width. SOL can use many different filters for different blurring effects, MGIF uses only one. Median has no measurable effect except to blur the image slightly. You were talking like this way a great feature of MGIF?!?!

- Convolutions are neat. Some of these effects can be had in SOL using filters, but these are pixel-dependent effects and do not work with a scaled image like Filtered Scaling does in SOL 3.x. MGIFs convolutions have a lot of edge detection stuff, that looks neat, but really has no use unless you can incorporate it into a robotic eye or something? Would any multimedia or desktop publishers ever use this? Again, I could only get a greyscale output with these, even in 24-bit mode.

- I can't combine any of these features! I can't use convolutions and brighten at the same time!

- Only one loaded image at a time in MGIF.

- Drawing is faster than SOL, but that is expected because all MGIF is doing is converting from the stored image to bit-plane format. SOL does lots of other operations (neccessary for scaling, color transformations/mapping, etc.) while drawing!

- GIF loading is very fast in MGIF, but other things? Forget it.

All tests on Falcon030 16Mhz 640x480x256 graphics mode using Speed of Light 3.7 and MGIF 4.4b

JPEG LOADING WITHOUT DSP:
Fixed palette F-S dithering/mapped output, 640x480 Truecolor, same image! BTW Johan, you can only use ordered dithering because you are not registered. Perhaps you'd like to contribute to my shareware efforts. Timing from load, uncompress, to completed display.

SOL: 30 sec MGIF: 45 sec (ouch! Even with "fast drawing!")

JPEG LOADING WITH SOME DSP CODE HELP:
Same parameters, same image.

SOL: 11 sec MGIF: 45 sec (N/A, no DSP)

GIF LOADING:
800x600x256 Image. Loading+uncompressing+display time.
Removed time SOL takes for palette optimization and other preprocessing that MGIF does not do (hence its lack of mapped image features.) MGIF draws very quickly, but again, it does no mapping, scaling, or histogram transformations while drawing. There is no way to remove these calculations from SOL's drawing time below. Note that all these calculations were left in SOL's times listed above.

SOL: 9 sec MGIF: 4 sec

(I don't know how you got 17 seconds in your post, Johan)

GIF SAVING:
640x480 64 color GIF Image.

SOL: 8 sec. MGIF: 22 sec. (ouch!)

Output file size was 3K less with SOL than with MGIF.

Frankly, I'm releaved. By the way you were talking, I thought MGIF would pose quite a competion to SOL in the image processing world (being free and all.) After seeing MGIF, I realize that you just can't compare the two. Obviously you've spent a lot of time trying to beat SOL's record for GIF loading (and you've done it!) and less time developing a good user-interface and well-rounded features. I hope this puts to rest any questions you may have had about MGIFs features versus SOL.

Perhaps now Dieter FiebelKorn or anyone else would like to point out to Johan the features that GEMview in fact includes that Johan said it did not. I have done so with SOL already. Obviously Johan does not read the manuals of the programs he uses before assuming what features they have or don't have.

I hope I have given everyone another point of view (although I will admit slightly biased) on MGIFs new features and use. I'm curious as to what other people think, as there hasn't been much response aside from just our author-biased public discussion.

Have fun!

As always, feel free to Email questions, comments, and suggestions for Speed of Light to me directly. That's the best way I can find out what users really want in SOL.

3021. BlowUP vs Screenblaster

Newsgroup: comp.sys.atari.st
Date: 1994-08-30 09:51:15 UTC
From: sanders@sci.kun.nl
Message-ID: <CvCE1F.56D@sci.kun.nl>
Source record: 181318

Hi,

My question is very simple. Should I buy a BlowUP or a
Screenblaster? Thus far I came up with only a few (dis)advantages of
both devices, of which the most important are:

Screenblaster:

+ Better supported in The Netherlands
+ Often comes with cheap NVDI package
- A bit more expensive

BlowUP:

+ Authors can be contacted via the net (very nice!)
- I'd have to buy it in Germany, which isn't a very big problem for
me.

Could some kind soul tell me what's the difference (again) between the
I and II versions? Screenblaster II is out, too. I don't have a
monitor yet, and I intend to wait with that until I'm sure I get the
perfect match 'BlowUP / monitor' (or Screenblaster, of course).

If the author(s) of BlowUP read this, please email me. I consider
them as *the* experts on monitors. If I want to spend, say, DM900 as
a *max*, what would be my best buy? 15", I presume... If anyone else
has something he/she wishes to share with me, don't hesitate! I'ts
quite a big expense for me, so I want to do it right.

P.S. For the authors of BlowUP: You can mail me in German, if you
like. I will answer in English, if you don't mind, because the errors
would certainly annoy you as hell. I can read it though.

Thanks in advance,

--

>: they're not in this case.
>
>B.S! The image was EXACTLY the same in both cases! Both had no scaling, etc.

As I explained in the part you cut out, MGIF used Floyd-Steinberg dithering,
not ordered dither. If you used F-S for SoL too, you've got a point. The
displayed images would still not be exactly the same, though, since my
F-S dither routine has a bug. ;-)

By the way, the timings for MGIF 4.2 vs MGIF 4.4 (exactly the same displayed
image) for ST mono on a Falcon with my favourite 640x480 GIF:

MGIF 4.2 MGIF 4.4
Time to quick preview finished 10.8 s 3.6 s
flicker start 31.7 s 10.3 s

MGIF 4.4 is far more comparable to SoL 3.7.

>: What kind of processing do you think is useful in this case?
>
>Well, for one thing, in SOL, you can have an arbitrary colormap, so SOL goes
...
>wanted to just view the image fast, I could use TGIF/MGIF without this ability.

OK, my point was that in most cases I don't think you want to use a user
defined palette etc when you view the images. If you do, SoL is your only
choice.

>: - Can those programs do median filtering.
>
>No, because they use Octree and Statistical methods. These are more accurate
>methods than your median method (discounted by scholars!)

Huh?
I said median _filtering_. That is used for example when you want to remove
single pixel noise in an image. It has nothing to do with quantization.

The quantization in MGIF is done using the code from the Independent JPEG
Groups library (used in _lots_ of software). Here is a short extract from
the jquant2.c file in that package:

```
* This module implements the well-known Heckbert paradigm for color
* quantization. Most of the ideas used here can be traced back to
* Heckbert's seminal paper
* Heckbert, Paul. "Color Image Quantization for Frame Buffer Display",
* Proc. SIGGRAPH '82, Computer Graphics v.16 #3 (July 1982), pp 297-304.
....
* Heckbert-style quantizers vary a good deal in their policies for choosing
* the "largest" box and deciding where to cut it. The particular policies
* used here have proved out well in experimental comparisons, but better ones
* may yet be found.
```

When the IJG decides that they've found a better algorithm to implement in
their code, MGIF'll get it ASAP.

```
>: - Can they do general convolutions (for example the ever popular
>: 'stone carving' effect, edge enhancement and edge detection).
>
>Not exactly, but Speed of Light has the incredibly powerful Filtering effects
>for 3D pixels, smooth reduction/enlargement, sharpening, and other effects.
```

Yes, those looks very nifty. They're a tad slow, though.
(Are you using 'Extrapolation by Error Energy Reduction', by chance. I saw
a picture in one of my books that looks extremly close to your pictures.
(Please email if you want to answer that.))

When I get around to adding some DSP code, I'll probably add some DCT filters
and such.

```
>Does MGIF do Filtered Image Scaling?
```

Well, to an _extremely_ limited degree. The expand and shrink functions
use averages to give better quality.

```
>: - Can they do logarithmic scaling of pixel values?
>
>YES! In fact, Speed of Light is EVEN BETTER with its customized color
>tranformations. The histogram editor allows for ANY type of pixel scaling.
>Contrast/Washout,Log Scale,Gamma Correction, Inversion, the LIST GOES ON!
```

Ah, that's right. I guess I should've mentioned rotating to any angle or
something like that instead. ;-)

```
>: - Can they process images in 24 bit colour and display them in 16/256/65536
>: colours?
>
>GEMview can, and SOL does this quite nicely, too! It easily handles
>truecolor images and reduces them down to 16/256 colors. No truecolor
```

>display yet, but you don't really need it since the 256 color display is so

But when SoL 3.5 has reduced the image to 256 colours, it's not a 24 bit
image any more. Of course that will not matter to most people.
If SoL can store images in 24 bit format internally, I'm sorry.

GEMview can of course have modules to do anything you may want.

With image processing I do not mean 'load and quantize', but I guess that's
all that most people'll need. I want to be able to change the RGB planes
individually with full quality maintained.

>good. Besides, on a Falcon, I find Truecolor modes unbearably SLOW!

They're not for the image processing in MGIF. A few examples:
(All modes in 60Hz, timing done with wrist-watch)
640x480x2ni 640x480x256ni 480x480ni TC
Displayed memory 2.3 Mb/s 18.4 Mb/s 27.6 Mb/s
Load 640x480 GIF in mapped mode 2.6 s 2.9 s 3.3 s
Load 640x480 JPEG in greyscales 15.7 s 21.8 s 29.0 s
Blur 4.0 s 5.0 s 5.6 s
Mirror vertically 4.1 s 4.7 s 5.3 s
Sobel filter 'stone carving' 13.1 s 15.0 s 18.5 s

In the worst case, the JPEG loading, the TC mode, with 12 times the display
memory was twice as slow as the monochrome mode.

Note that the TC mode was as bad as it can possibly get regarding memory
contention on a Falcon. The single bit mode was the opposite (nearly).

>: - Can they display in Falcon true colour mode using F-S dithering?
>
>GEMview can, always has!

No, it can not (Unless someone has written such a module.)
It says explicitly in the manual that the F-S dithering is used only to reduce
the number of colours.
MGIF uses F-S in Falcon TC in the same way as in monochrome, only full colour.

>: I couldn't find any of those features in either, last time I looked.
>
>LOOK AGAIN!

OK, I did and I admit I was confused regarding the log scaling and that the
module concept in GEMview makes it able to do anything.

>Lets not list all the features, or we'd go on forever! There are many
>features in Speed of Light and GEMView that MGIF is INCAPABLE OF!

Of course there is. I was just objecting to the way you called MGIF
featureless. It simply has a different selection of features than SoL.
For many (most?) people the selection in SoL may be the right one, but for me
MGIF wins hands down.

>This discussion is just become a frickin' advertisement!

I'd rather say it starts to look almost like a flamewar. That's not something
I ever expected to find myself in.

The above paragraph is utter rubbish I'm afraid. The law of copyright says no such thing that I am aware of either internationally or demosticly.

I believe that OPUS is no longer supported although I could be wrong. A pity as it was a nice spreadsheet. If the 15$ has been cashed then he presumably got the check, but not defintely. Your bank will be able to tell you which account it was paid into, they may charge for looking it up though. If he *did* get the cheque then you have claim against him if you got nothing in return.

3030. Idealist question.

Newsgroup: comp.sys.atari.st
Date: 1994-08-30 15:18:09 UTC
From: cf580@city.ac.uk
Message-ID: <1994Aug30.151809.15969@city.ac.uk>
Source record: 181253

Hi all. I've oulled the Idealist program, and it looks really good except for one thing. I'm using continuous A4 paper and no matter _what_ I change in the printer config file, I can't get the program to use 70 lines per page. Hence it rapidly gets out of sync unless I reset top of page at the start of each sheet, which kind of negates the advantage of continuous paper.

If someone could explain the meanings of the various variables in the config file (or if I'm trying to do entirely the wrong thing here) then I'd greatly appreciate it.

I'll see if there is anything I should add. ;-)

>- All items under the "point" menu can be EASILY done with the histogram
>editor in SOL 3.x. Contrast, inverse, brighten, darken, log, threshold,

All true. If I had the time I could of course add a GEM based histogram
editor. Version 5.0 of MGIF will certainly have one, but it's not certain
that it'll ever materialize. If it ever does it's more than a year from now.

>- Still NOT GOOD COLOR SUPPORT! Sure, you can load in 256 color GIFs
>and display them on your 256 color falcon, but if you want to use any of
>the image processing features, you have to switch to greyscale,
>otherwise you get a garbled grey output (with color). If you switch to

The garbled output is there only because those features are not disabled yet.
They don't work in mapped mode, but I've never got around to fixing it. I
know what functions work, so I never get the strange results... ;-)

>24 bit, only a small number of the features work in color. Most produce

That is not true.
All the features works in 24 bit mode. You just have to be careful with
the use of the RGB mode switch. I think this is mentioned in the FAQ.
After all, 24 bit mode _is_ greyscale mode with two extra buffers!

>a greyscale output and can take up to a minute for a small 640x400x256

Most of the functions are rather speedy, but the 'Oil paint' function
can take that long. I've not seen it anywhere else on the ST before, though.
It's the same as in XV 3.0 if anyone is interested. It's implemented a bit
smarter in MGIF, though, to get _somewhat_ useful speed.

>GIF on a 16Mhz Falcon030. None of the functions seem to work with
>mapped images! Now you see why Speed of Light does all that

Scaling works fine with mapped pictures, as does median filtering and
the oil paint function. There is not much point in doing anything but
palette manipulations on a mapped image, since so _very_ much of the
information is already lost. Palette manipulations needs a much more
advanced GUI, which is the reason they're not available.

>processing...it's for handling mapped images with all it's features!
>MGIF can't even do this, so why compare them, Johan?

They can both display mapped images and they can both scale them. Aren't
those by far the most used features?

MGIF is not a palette based image processing program, I've never seen one,
but rather a greyscale/RGB one with some _simple_ palette features.

The only comparison between them that is even a bit valid, is their ability
to display images in a way the user wants. The two programs have quite
different philosophies for doing that, though.

>- I could only get the thing to zoom *2 or /2. There is a scale
>feature, but if your image goes off the screen...tough luck. There is

The scale can scale to any size from 1x1 pixels and up (there is a bug in
the dialog box now that prevents >1000 pixels).

(Why would you scale the image _up_ so that it doesn't fit on the screen?
If it was larger from the beginning I could understand but...)

>no scrolling so you can't see the rest of the image!

No, I don't believe in adding such features to MGIF. I got some code to do
it from a guy who's been helping me out, though, a couple of days ago, so
it _might_ get into v4.4 before release.

If you want to scroll around an image larger than the screen, just run with
a virtual screen program installed.
MGIF works nicely with the virtual screen in BlowUP030 for example.

>- Rotation is nice, can do it in integral degrees. I personally would
>never use anything but 90 deg. anyway.

No, I guess not many ever will, but it was something I once found
interesting to do. ;-)

>- Sheer? How boring. Warping in SOL is incredibly more powerful!

Yes, the shear is probably useless and should perhaps be removed from
the menu. It was needed for the rotation, that's why it's implemented.
Noone has asked for warping and I don't need it myself, so it's not there.

>- Oil effect is cool. Blur can be easily done in SOL by scaling any

I liked the oil effect when I found it in XV 3.0 a couple of weeks ago.
That's how most features gets added to MGIF. ;-)

>Standard filter in width. SOL can use many different filters for
>different blurring effects, MGIF uses only one. Median has no

You can do many kinds of blur using the convolutions. The one in the
menu is the same as the first low pass filter, only faster.

>measurable effect except to blur the image slightly. You were talking
>like this way a great feature of MGIF?!?!

Median filtering is not useful on good images. It is used to remove
spurious pixel noise. (If applied a number of times on the same image it
can give interesting effects too.)
Can SoL do anything about such an image?

>- Convolutions are neat. Some of these effects can be had in SOL using
>filters, but these are pixel-dependent effects and do not work with a
>scaled image like Filtered Scaling does in SOL 3.x. MGIFs convolutions
>have a lot of edge detection stuff, that looks neat, but really has no
>use unless you can incorporate it into a robotic eye or something?

As is explained in the FAQ, the edge detection filters can be used with
a bias value of 128 to give the popular 'stone carving' effect. You
can also use them to simply enhance edges if you add 1 to the center
value in the matrix.

>Would any multimedia or desktop publishers ever use this? Again, I

Edge detection together with a thresholding can produce good working
material for a line-tracer.

>could only get a greyscale output with these, even in 24-bit mode.

You must of course set the destination buffer to the same as the source
buffer (or do a copy afterwards). RT(fine)M!
The grey buffer can be used for trial purposes, though.

>- I can't combine any of these features! I can't use convolutions and
>brighten at the same time!

No, but you can apply them after each other. That is the whole point in the
concept used by MGIF.
It would be a _bit_ difficult to support
histogram equalization +
sobel edge detection with bias 128 +
contrast expansion +
low pass filter
while drawing, don't you think?

>- Only one loaded image at a time in MGIF.

Yes, but I'll add some kind of simple multi-image support for combination
purposes, before the release. Again it's a conceptual reason.

>- Drawing is faster than SOL, but that is expected because all MGIF is
>doing is converting from the stored image to bit-plane format. SOL does

Yes, because that's the best way to do it IMHO.

>lots of other operations (neccessary for scaling, color
>transformations/mapping, etc.) while drawing!

True, MGIF will never do all that.

>- GIF loading is very fast in MGIF, but other things? Forget it.

It's got the best display quality for 24 bit images in Falcon TC mode of any program I've seen. (I've not seen DA's picture, by the way. ;-)
As I said in another reply, GEMview does _not_ do F-S in TC, only while reducing colours. At least that's what the manual says.
(There might of course be modules that do this.)

One of MGIF's best features is that it's FreeWare in my opinion. You can even get the complete sources if you want to use them in a FreeWare package. Some of the sources are not by me, however, so they can have different distribution rights.

>All tests on Falcon030 16Mhz 640x480x256 graphics mode using Speed of
>Light 3.7 and MGIF 4.4b
>
>JPEG LOADING WITHOUT DSP:
>Fixed palette F-S dithering/mapped output, 640x480 Truecolor, same image!
>BTW Johan, you can only use ordered dithering because you are not

There is no F-S dither mentioned at all in the documentation for 3.5 or in the pop-up menus. Is this a new feature in 3.7?

MGIF does ordered and dither and halftoning with the correct .DIT or .DTT files as well as F-S dither.

>registered. Perhaps you'd like to contribute to my shareware efforts.

No, SoL does not have any the features I want that MGIF doesn't have.
Neither does GEMview, by the way.
As soon as this discussion dies, they're both gone from my HD.

>Timing from load, uncompress, to completed display.
>
>SOL: 30 sec MGIF: 45 sec (ouch! Even with "fast drawing!")

Not bad! There have always been programs that do JPEG decompression much faster than MGIF, so I'm not the least depressed. ;-)
I have in fact not worked more than perhaps 15 minutes to get the speed I have in MGIF. I simply compiled the IJG package.

Perhaps you should try the same picture in greyscales and the octree mode as well, though?

(I have only SoL 3.5 to compare with, so any numbers I give will of course be based on that.)

I tried five JPEGs in greyscale mode in both MGIF and SoL. The timings were almost identical!

Four of those (one was too big) were tested again with the default colour settings for SoL (octree, 10%, no dither, 5 bit) and the corresponding MGIF mode (two pass, no dither).
--- In that test MGIF was 30-100% faster than SoL 3.5! ---
The quality of the generated 256 colour pictures were the same in my eyes.

The problem with the SoL quantize was the reverse colour map calculation.
It took a large part of the time, which accounts for the 100% speed
difference for the small JPEG I tested.
In the IJG library the reverse map is generated only for the needed values,
which is much faster most of the time. Perhaps an idea for 3.7 if you've
not already implemented it.

>JPEG LOADING WITH SOME DSP CODE HELP:
>Same parameters, same image.
>
>SOL: 11 sec MGIF: 45 sec (N/A, no DSP)

Impressive!

If someone sends me money I'll add support for Brainstorms decoder. ;-)
I'll look into doing some work with the DSP later. That's number two on
my non-MGIF44 priority list right now.

>GIF LOADING:
>800x600x256 Image. Loading+uncompressing+display time.
>Removed time SOL takes for palette optimization and other preprocessing
>that MGIF does not do (hence its lack of mapped image features.) MGIF
>draws very quickly, but again, it does no mapping, scaling, or histogram
>transformations while drawing. There is no way to remove these
>calculations from SOL's drawing time below. Note that all these
>calculations were left in SOL's times listed above.
>
>SOL: 9 sec MGIF: 4 sec
>
>(I don't know how you got 17 seconds in your post, Johan)

I did not remove the palette optimization etc since SoL always does them,
naturally. I think that was reasonable when none of them did anything
useful in any case. Didn't I mention that somewhere?

>GIF SAVING:
>640x480 64 color GIF Image.
>
>SOL: 8 sec. MGIF: 22 sec. (ouch!)
>
>Output file size was 3K less with SOL than with MGIF.

This is another area where I've not done anything at all. It's all left to
the IJG libraries. In fact the GIF saving was simply a bonus when I added
support for Targa and PPM save.

I've only saved GIFs to test that it worked. Noone has asked for more speed
yet, but I'd probably look into it if someone did. That's the kind of
coding I like to do. ;-)

>Frankly, I'm releaved. By the way you were talking, I thought MGIF
>would pose quite a competion to SOL in the image processing world (being

I can't imagine anyone using SoL 3.5 for image processing. It doesn't match even the smallest specification list I can think of.
Image processing on mapped images is a contradiction in terms as far as I'm concerned.
I guess you have another definition of the term. ;-)

>free and all.) After seeing MGIF, I realize that you just can't compare

They're two very different beasts, sure.
In some cases comparisons are still valid, but I guess you and I are a bit too biased to do them. ;-)

>the two. Obviously you've spent a lot of time trying to beat SOL's
>record for GIF loading (and you've done it!) and less time developing a

No, MGIF had the record before SoL came around. It was almost on par while the decoder was still written in C in v4.4. A simple optimization of the GCC produced code gave near twice the speed. Another couple of hours made it faster than TGIF.
Optimizing code is fun!
If I'd thought there'd be a point in doing more, I'd do it.
I _have_ to get a pipeline diagram/explanation and a cycle count list for the '030 first, though.

>good user-interface and well-rounded features. I hope this puts to rest

The user interface has had a relatively low priority, that's true. I develop MGIF in my spare time for fun. My idea of fun does not include writing GUIs yet. Thank god there is gem++!

>any questions you may have had about MGIFs features versus SOL.

I still think everyone should try both programs. I'll even put a notice in the MGIF documentation that there are other programs (GEMView and SoL) that might suite some (all?) users better.

>Perhaps now Dieter FiebelKorn or anyone else would like to point out to
>Johan the features that GEMview in fact includes that Johan said it did

I've replied to the other message and said this already, where it was true. The module concept in GEMView makes it difficult to say what's there and what's not.

>not. I have done so with SOL already. Obviously Johan does not read

>the manuals of the programs he uses before assuming what features they
>have or don't have.

And you had when you claimed MGIF was _featureless_?
Why didn't you know about the RGB mode switch for manipulating images in MGIFs 24 bit mode? That's a rather basic feature in mgif 4.4 and it _is_ in the manual! ;-)

The only thing I got wrong about SoL, in my interpretation (I wrote the points), was the log scaling. The implementation was so different that I simply didn't realize that it could do the same thing.

Again, the modules in GEMview makes it impossible to say anything conclusive about it.

>I hope I have given everyone another point of view (although I will
>admit slightly biased) on MGIFs new features and use. I'm curious as to
>what other people think, as there hasn't been much response aside from
>just our author-biased public discussion.

Yes, I'd like to hear some other opinions too. Perhaps noone is interested?

>As always, feel free to Email questions, comments, and suggestions for
>Speed of Light to me directly. That's the best way I can find out what
>users really want in SOL.

The same applies MGIF users, but I reserve the right to do what I want about your suggestions, since you're not paying me anything. ;-)

Hi there,

Is there anywhere available, a version of Nethack 3.* that will run on an ST with only 1 Meg of Ram?? I know about the earlier version 2.3 that was ported by Eric Smith. I'd just be interested to see a later version running.

Any suggestions welcome! :-)

You have only payed your Shareware fee to use OPUS 2.2, if you are that dumb that people are still supporting the Atari till doomsday...

Rule of thumb, never shed money out and Shareware software unless you know its being supported, like write a letter firsts, if you check you will find that OPUS 2.2 is very very old....

As they say get a life get a PC.....

...
>- Only one loaded image at a time in MGIF.

You _REALLY_ should have read the manual. You obviously don't know how
the RGB and multiple buffer systems work. You could also have been a bit
more... ahh... Tactful? If I didn't know better, I would say several of
your comments were direct attacks on MGIF.

>Frankly, I'm releaved. By the way you were talking, I thought MGIF
>would pose quite a competion to SOL in the image processing world (being

>any questions you may have had about MGIFs features versus SOL.

You can't cite the user interface. You are looking at a beta version,
and the newest addition is _GEM_! The interface isn't finished yet. If
you knew how to _USE_ the features, I'm sure you'd find it a very powerful
program.

>Perhaps now Dieter FiebelKorn or anyone else would like to point out to

I think SoL is fantastic, wonderful, incredible, amazing for colour ST/STes. However, I think MGIF is better suited to my needs and my system. I also really like the fact that the source code is available, which obviously isn't an option for you.

Subject: The Truth about MGIF 4.4 WAS: GIF & JPEG Viewers
Message-ID: <CvCCEH.F16@beaver.cs.washington.edu>
Sender: news@beaver.cs.washington.edu (System PRIVILEGED Account)
Organization: Computer Science & Engineering, U of Washington, Seattle
X-Newsreader: TIN [version 1.2 PL2]
Date: Tue, 30 Aug 1994 09:15:37 GMT
Lines: 127

OK, I've looked over MGIF 4.4 beta, and here's what I think (as discussed before, MGIF vs. Speed of Light, GEMview, etc.) Comments on MGIF's features with comparison of SOL to MGIF.

- All items under the "point" menu can be EASILY done with the histogram editor in SOL 3.x. Contrast, inverse, brighten, darken, log, threshold, etc. Everthing! PLUS, SOL's histogram editor is much more customizable and flexible. You aren't fixed to specific features like in MGIF.

- Still NOT GOOD COLOR SUPPORT! Sure, you can load in 256 color GIFs and display them on your 256 color falcon, but if you want to use any of the image processing features, you have to switch to greyscale, otherwise you get a garbled grey output (with color). If you switch to 24 bit, only a small number of the features work in color. Most produce a greyscale output and can take up to a minute for a small 640x400x256 GIF on a 16Mhz Falcon030. None of the functions seem to work with mapped images! Now you see why Speed of Light does all that processing...it's for handling mapped images with all it's features! MGIF can't even do this, so why compare them, Johan?

- I could only get the thing to zoom *2 or /2. There is a scale feature, but if your image goes off the screen...tough luck. There is no scrolling so you can't see the rest of the image!

- Rotation is nice, can do it in integral degrees. I personally would never use anything but 90 deg. anyway.

- Sheer? How boring. Warping in SOL is incredibly more powerful!

- Oil effect is cool. Blur can be easily done in SOL by scaling any Standard filter in width. SOL can use many different filters for different blurring effects, MGIF uses only one. Median has no measurable effect except to blur the image slightly. You were talking like this way a great feature of MGIF?!?!

- Convolutions are neat. Some of these effects can be had in SOL using filters, but these are pixel-dependent effects and do not work with a scaled image like Filtered Scaling does in SOL 3.x. MGIFs convolutions have a lot of edge detection stuff, that looks neat, but really has no use unless you can incorporate it into a robotic eye or something? Would any multimedia or desktop publishers ever use this? Again, I could only get a greyscale output with these, even in 24-bit mode.

- I can't combine any of these features! I can't use convolutions and brighten at the same time!

- Only one loaded image at a time in MGIF.

- Drawing is faster than SOL, but that is expected because all MGIF is doing is converting from the stored image to bit-plane format. SOL does lots of other operations (neccessary for scaling, color transformations/mapping, etc.) while drawing!

- GIF loading is very fast in MGIF, but other things? Forget it.

All tests on Falcon030 16Mhz 640x480x256 graphics mode using Speed of Light 3.7 and MGIF 4.4b

JPEG LOADING WITHOUT DSP:
Fixed palette F-S dithering/mapped output, 640x480 Truecolor, same image!
BTW Johan, you can only use ordered dithering because you are not registered. Perhaps you'd like to contribute to my shareware efforts.
Timing from load, uncompress, to completed display.

SOL: 30 sec MGIF: 45 sec (ouch! Even with "fast drawing!")

JPEG LOADING WITH SOME DSP CODE HELP:
Same parameters, same image.

SOL: 11 sec MGIF: 45 sec (N/A, no DSP)

GIF LOADING:
800x600x256 Image. Loading+uncompressing+display time.
Removed time SOL takes for palette optimization and other preprocessing that MGIF does not do (hence its lack of mapped image features.) MGIF draws very quickly, but again, it does no mapping, scaling, or histogram

transformations while drawing. There is no way to remove these calculations from SOL's drawing time below. Note that all these calculations were left in SOL's times listed above.

SOL: 9 sec MGIF: 4 sec

(I don't know how you got 17 seconds in your post, Johan)

GIF SAVING:
640x480 64 color GIF Image.

SOL: 8 sec. MGIF: 22 sec. (ouch!)

Output file size was 3K less with SOL than with MGIF.

Frankly, I'm releaved. By the way you were talking, I thought MGIF would pose quite a competion to SOL in the image processing world (being free and all.) After seeing MGIF, I realize that you just can't compare the two. Obviously you've spent a lot of time trying to beat SOL's record for GIF loading (and you've done it!) and less time developing a good user-interface and well-rounded features. I hope this puts to rest any questions you may have had about MGIFs features versus SOL.

Perhaps now Dieter FiebelKorn or anyone else would like to point out to Johan the features that GEMview in fact includes that Johan said it did not. I have done so with SOL already. Obviously Johan does not read the manuals of the programs he uses before assuming what features they have or don't have.

I hope I have given everyone another point of view (although I will admit slightly biased) on MGIFs new features and use. I'm curious as to what other people think, as there hasn't been much response aside from just our author-biased public discussion.

Have fun!

As always, feel free to Email questions, comments, and suggestions for Speed of Light to me directly. That's the best way I can find out what users really want in SOL.

3047. Power Monger

Newsgroup: comp.sys.atari.st
Date: 1994-08-31 00:08:35 UTC
From: Frits_Van_Den_Akker@sterbbs.nl
Message-ID: <18499KSDNASHICXKEBX@sterbbs.nl>
Source record: 181334

I found a copy of Power Monger between on of mine _very_ old disks.
I don't know wether it's PD or not. (I'm afraid it's a pirated copy;
I can't remember were I got it from. It's just on one of the disk I
think I own.)
Anyway, I don't know how I have to use it; can't find it out either.
It seems like an different ST-version of Populus....

Does someone know how I can use it or if the program isn't PD?
If it isn't: I'll delete it inmidiately; I don't like pirated
programs very much....

Thanks!

Frits.

Howdy,

Try Atari ST Internals (By Data Becker) or The Atari Compendium,
both books have the tables along with descriptions...or if you can't
find either of those...I suppose I could type the tables in and e-mail
them...

Cheers,

Source record: 181347

I don't see what is so good about F-S dithering in TrueColor modes? There is not that much of a loss...

Also, I did have the RGB mode switch ON when doing convolutions, and they STILL produces greyscale results. Mapped images produce GARBAGE! And to get any decent output in 16/256 modes, I have to quantize EVERY TIME!

And your comment about SOL not being an Image Processor because it only works on mapped images is crap! Not only does SOL work beautifully on greyscale modes, but mapped images are 100% as valid an image to process!
It's an image, isn't it? We're processing it, aren't we?

What's your convoluted notion of an Image Processor? Only greyscale? B.S.

Every text I haved looked in that has ANY image processing information works with mapped images just as well as TC or Grey Images. You simply do all processing in Truecolor (as in filtering) and then map things to a palette while drawing. Easy. If you're in greyscale (as with SOL) you don't need to map it.

Not an image processor...what crap!

Cheers, and solutations.

Stuart

Stuart,

I liked SOL enough to register it, even though I don't use color much. I'm very happy you're working on a mono version. I don't understand all of its features yet, but I like the program.

Since this exchange began (you and Johan), I got a copy of MGIF. It too is very impressive (at least to me). I would like to see a print feature and some other Save formats (.IMG, etc.), but it still seems pretty powerful.

I think you, Stuart, have every right to be proud of SOL, and to clear up misuderstandings about its capabilities. But I think your criticism of MGIF casts you in an unflattering light. I'd rather see you speak positively about your program without the (apparent) hostility toward another author.

Scalable fonts are:
1. Bitstream's Speedo fonts (fast)
2. Truetype
3. Postscript (poor quality at small point size)

SpeedoGDOS v5 uses all three plus other GDOS fonts.
That's Write 3 uses Speedo via it's own internal scaler.

I said _Falcon_ TC mode. That's 16 bits and the loss is _very_ obvious in many
pictures if you don't dither. Try the test image creation in MGIF and you'll
see a good example of the improvement you can get.

>Also, I did have the RGB mode switch ON when doing convolutions, and they
>STILL produces greyscale results. Mapped images produce GARBAGE! And to get

I assure you that you get RGB results when you use that switch!
The article from Mike Pelletier shows that other people have no problem
getting it right by reading the manual. ;-)

If you try to display the image using the 'draw source' or 'draw destination'
selections in the menu, MGIF will of course do exactly that!
Can you guess what the 'draw RGB' item is used for? :-)

Most of the image processing functions are not supposed to work at all in
mapped mode. They produce garbage because they're not disabled yet.

As I said before, scaling, median filter and oil paint works fine in mapped
mode. If you read the manual you might find out what you're doing wrong. ;-)
It's quite possible that you won't, of course. That's why I always include the
following line in my MGIF distributions nowadays:

When (not if) you have any questions, please mail.

Did I forget that line when I mailed MGIF 4.4beta to you?

>any decent output in 16/256 modes, I have to quantize EVERY TIME!

Huh, what are you talking about?
If you load an image in mapped colour mode you _can't_ quantize it! In 256
colours it will be displayed as loaded, in 16 colours you have the option
of using an ordered dither to display.
SoL does a much better display in 16 colours, though.

Since you're talking about quantization, I guess you've loaded the image in
24 bit mode. Why have you done that if you can't get the RGB features to work?

I really can't understand what you mean here.
You said earlier that you could only get greyscale output using the RGB switch.
That must mean you've not discovered 'draw RGB' in the menu.
Without using that you can't get any multi-colour output from a 24 bit image.
Decent or otherwise!

In any case, you must remember that MGIF is doing a simple 24 bit to mapped conversion, while drawing, for preview purposes only.
With a decent dither matrix (try one of the ones supplied in SoL ;-) and a relatively high resolution, the preview results are not too bad. In 256 colours the output is usually rather good. It always depends on the dither matrix, however, and the supplied one is not top notch by any means.

When you're done with your image processing, use quantize with maximum settings for quality output in any number of colours (8-256).

>And your comment about SOL not being an Image Processor because it only works
>on mapped images is crap! Not only does SOL work beautifully on greyscale

A few quotes:

I can't imagine anyone using SoL 3.5 for image processing. It doesn't
^
match even the smallest specification list I can think of.
^
Image processing on mapped images is a contradiction in terms as far as
I'm concerned.
^
I guess you have another definition of the term. ;-)

I think that looks like my _personal_ views, don't you?

>What's your convoluted notion of an Image Processor? Only greyscale? B.S.

The most important thing is _IMHO_ the capability to define your own general convolution filters. Of course the 3x3 filters in MGIF is a bit too small, but 5x5 or 7x7 filters would be _sloooow_ without DSP help.
_I'd_ be unhappy if there was no median filter or some general 'despeckle' like functions.
_I_ need intensity manipulation features. Yes, I admit SoL has more of that!
For colour, 24 bit is a must, again _IMHO_ of course.

>Every text I haved looked in that has ANY image processing information
>works with mapped images just as well as TC or Grey Images. You simply
>do all processing in Truecolor (as in filtering) and then map things to
>a palette while drawing. Easy. If you're in greyscale (as with SOL)
>you don't need to map it.

That's the way MGIF is doing it when you use only 'draw RGB' in the palette modes!
SoL (at least up to v3.5) quantizes the image at load time, loosing a _lot_ of information.

>Not an image processor...what crap!

IMNSHO!

:-))

I think they should be able to learn these few words by using a dictionary.
This method will be better than just reading it.

>as well as Marcel. a shareware editor.
>-scott tirrell

Calligrapher Pro that is being sold of cheap in the UK, for 39 Pounds,
that also has support for RTF files, plus a few other good thing going for it,
but the big minus is the lack of Fonts, there are only 84 extra ones and they
are not that cheap, they don't even have a Chancery font, and no PD fonts or a
converter...

But at 39 ponds its a good buy, has PostScipt plus a very good Dictionary
and Thesaurus, and French/German/Italian and Spanish...

I think there is only one other Document/Word Processer that has this kind
of language support...

It is a commercial product, so yours is very likely pirated. I am not a big fan of the game itself. They basically took the Populous/PopulousII concept and made it extremely complicated and information-dense, which tends to take the fun out of it (for me, at least). At least one data disk was produced for this game (WWI scenarios, I believe). Populous II is the king of the God games IMHO, particularly via modem against another human.

3076. FOR SALE: Mint Condition Atari ST

Newsgroup: comp.sys.atari.st
Date: 1994-08-31 14:55:47 UTC
From: VP_Ostrander@pnl.gov
Message-ID: <3425lj$mng@bbs.pnl.gov>
Source record: 181370

I have a mint condition Atari 520ST for sale that I bought
a few years ago and have hardly used. It is a 520ST with
a external double-sided drive, mouse, monitor, all power
supplies, cables (etc.). It is currently setting in my basement
in the original boxes. I only ever bought one software program -
it is a word processor the name of which I can't recall.

Make offer.

3077. Sound Chip for the Atari 520/1040/Mega ST

Date: 1994-08-31 15:02:24 UTC
From: lupien@eng.mc.xerox.com
Message-ID: <1994Aug31.150224.4149@news.wrc.xerox.com>
Source record: 181395

Hey,

Does anyone know of a source for (or have any that they
were willing to sell) the sound chip used in the first ST's? You
know the problem where you zap the chip and the disk stops working
because part of the disk controller is on the sound chip? Well,
that's my problem.

Any source whatsoever. Old dead ST's (that did not die the
same way) Distributors, yourself, whatever.

GOT A SOUND CHIP??? Please write back to gfl.xkeys@xerox.com

THANKS!!!

Gordon

Please: that's a 'Murkin', not a 'merkin', which is something else entirely.
And I do have a German-English dictionary--several of 'em even. I may not
be a good representative because I took a German course once (not TOO bad
a representative, though, since I got a charitable 'D'). Anyway, the easy-to-
come-by dictionaries were written before little computers became common,
and a lot of definitions that are appropriate for program menus are only
metaphorically related to the ones given in the old dictionaries. From time
to time I've shown technobabble to a German co-worker who's sharp with small
computers, but has been in the US since before the micro revolution started,
and he often has to think a while to figure out what's being talked about.

So anyway, thanks for the effort. It's kind and it's worthwhile.

Steve

3084. Does Speedo 5 support the Epson 2500?

Newsgroup: comp.sys.atari.st
Date: 1994-08-31 18:54:45 UTC
From: bjgrier@bnr.ca
Message-ID: <342jll$edf@nrtphaa9.nt.com>
Source record: 181375

When I purchased Atari Works/Speedo GDOS 4.1, the only Epson
driver it supported was the LQ570. However my printer is only
LQ2500 compatable. The difference is my printer, and the LQ2500
supports only 360x180 dpi while the LQ570 supports up to 360x360
dpi. As a result I have to use the NX-1000 driver (180x180 dpi).
The dot resolution in the LQ570 driver does not seem to be adjustable.

Does anyone know if the Speedo 5 drivers support the Epson LQ2500,
360x180 dpi, printer? Or is the LQ570 driver now configurable to
360x180 dpi?

Thanks in advance,
Brian

There's a topic on Frontier in the GEnie Atari Forums. Don't know about
Civilization, but lots of "cheats" are posted for Frontier. If you want
them and can't get to 'em, let me know and I can d-l whatever's there.

3087. HELP! Question about FRONTIER : ELITE 2 and CIVILIZATION

Newsgroup: comp.sys.atari.st
Date: 1994-08-31 22:15:34 UTC
From: eliassen@aviris382.jpl.nasa.gov
Message-ID: <eliassen-3108941415340001@avirislab.jpl.nasa.gov>
Source record: 181379

Well, I got plenty of requests for information when I got an answer on these but I never received any responses other than requests for the information when I got it.

So, I'll ask again.

Does anyone have any of the cheats/bug fixes/ANYTHING regarding Frontier : Elite 2 or Civilization?

If you don't know anything regarding these but know of someplace I might find out, please let me know. Calling overseas is a bit of a joke.

Any help would be greatly appreciated.

Thanks.

Miraden

3089. Re: The Truth about MGIF 4.4

Newsgroup: comp.sys.atari.st
Date: 1994-08-31 23:03:25 UTC
From: THIETAVUO@FINABO.ABO.FI
Message-ID: <1994Aug31.230325.6004@abo.fi>
Source record: 181388

Some user opinions about SoL, MGIF and GemView...

I have good memories of MGIF from the time I used a Mega-ST. The program even worked with a 40 MHz accelerator ;-) ! Since I moved to Falcon, MGIF was forgotten (I simply didn't know it worked on Falcon!) for a while. The program worked very well although the user interface was quite confusing. For monochrome GIF viewing on a ST, MGIF could still be unbeatable. I'm looking forward to a more Falcon-oriented version of MGIF (support for screen enhancers and multitasking?). Maybe the new 4.4 does all that; we'll see!
A special bonus award for the author of MGIF: during the ongoing, sometimes quite nasty sounding conversation, Johan's calm and polite attitude just surprises me (positively)!

SoL 3.5 is great on Falcon; there's no arguing against that. The program is very well written and certainly worth registrating (wish it was a bit easier from Finland.. The extra fees the bank takes, easily double the total price... But I guess the same thing happens almost everywhere. Sending money abroad IS expensive..!). Yes, I like SoL - but I think it's quite a different kind of a program compared to MGIF, so the war between those two programs doesn't feel very sensible? BOTH are good programs, so why fight ;-) ?!

But GEMVIEW... I must say I don't like this program very much today. I used to like it - but with its modular design it's became slow. Way _too_ slow, I think... =-(Just make it load a big GIF file with dithering, and you'll understand what I mean! The user-interface may be clever, but I find it difficult to use sometimes. Sometimes it's just not logical at all. It's too often hard to say what the program is really doing - or if it's going to do anything. GemView has some great features, too (conversions from one format to another, for example work mostly fine) - and since it supports almost every imaginable CPU, screen and colour combination, it's very well programmed.
Some speed and a new, better user interface - well... THEN we'd have something very special!

Btw: the new GemView 3.06 found in ftp.uni-kl.de, cnam.cnam.fr and umich.edu seems to be somehow faulty? I couldn't install it (the inst. prg complained that the packets were wrongly coded, or something..) at all. Previously: no problemos. Anybody knowing about the problem?

Greetings (and luck to all the MGIF/SoL/GemView/etc programmers ;-),
Tommi

3090. Gemulator 3

Newsgroup: comp.sys.atari.st
Date: 1994-08-31 23:59:01 UTC
From: otohnspa@indirect.com

Can't see this code in my manual :-(

>I've tried re-formatting the drive using the ICD utilities disk. I'm not
>sure if it's working 'cause it only says "FORMATTING" on the screen for a
>few seconds and then goes into a GEM type screen without any pull-down

This doesn't sound right. I formated a drive last night with ICD Pro 6.5.1,
and it did more than this. Does it take you to the partition screen, and
did it do the bad sector check?

The oldest ICD (non Pro) utilites I've used are 4.6.2, and even they did
the above steps AFAICR.

What ICD software are you using?

Roland.

From: masona@aol.com
Message-ID: <343617$esj@search01.news.aol.com>
Source record: 181384

I am afraid that due to the lack of support by the Tramiel family and the Atari Corp. plus the fact that our school system is receiving Macs by the truckload that I have had to make the switch to Apple. I kind of hated doing it since my Mega STe is really a nice piece of equipment and I got used to doing a lot of things with it.

One of the things I have difficulty with is giving up all of my clip art and graphics libraries. I still plan to do a lot of dtp with PageMaker, but I am currently short on graphics and can't afford a scanner right now.

I have an Atari to Mac graphics converter program, but my Mac won't read the Atari disks. Does anyone have any idea how I can port them over? I do have a Golden Image floppy drive that I could hook up, but I'm not sure where or how since both pieces of equipment have dissimilar cabling.

If you have an idea, I would be pleased to hear it. You can email me on AOL at MASONA, leave word here, or "net it" to me at aldricm@firnvx.firn.edu.

Actually, the dictionary that I use to translate german
technobabble is the Collins German Concise Dictionary, and it's
very rarely failed me (maybe twice in about 40-45 program
translations), in which cases I used Alfred_E in a text editor
accessory. As for being a good representative, I have never taken a
german language course in my life. (My name is from a previous
marriage of my mother to a german fellow, which I never felt like
changing to anything else.

Johan Klockars (d8klojo@dtek.chalmers.se) wrote:

: I said _Falcon_ TC mode. That's 16 bits and the loss is _very_ obvious in many
: pictures if you don't dither. Try the test image creation in MGIF and you'll
: see a good example of the improvement you can get.

True, I see your point.

: I assure you that you get RGB results when you use that switch!
: The article from Mike Pelletier shows that other people have no problem
: getting it right by reading the manual. ;-)

I did read the manual, but I think my problem was in the final output buffer.
I got greyscale results that first time (yesterday) when convoluting and
the RGB switch was on. This could be a contrast problem, however.

: If you try to display the image using the 'draw source' or 'draw destination'
: selections in the menu, MGIF will of course do exactly that!
: Can you guess what the 'draw RGB' item is used for? :-)

Thanks for the info, but I already read that in the manual.

: Most of the image processing functions are not supposed to work at all in
: mapped mode. They produce garbage because they're not disabled yet.

Not disabled? You mean not ENABLED.

: mode. If you read the manual you might find out what you're doing wrong. ;-)
: It's quite possible that you won't, of course. That's why I always include the

It's quite possible that _I DID_, but your UI is confusing. You need some kind
of dialog box to lay out all the source to dest transfers. Using only
menus is confusing...hope this helps.

: >any decent output in 16/256 modes, I have to quantize EVERY TIME!

: Huh, what are you talking about?

I mean to get output to be anything like SOL, you have to quantize after every
image process.

: >And your comment about SOL not being an Image Processor because it only works
: >on mapped images is crap! Not only does SOL work beautifully on greyscale

: I think that looks like my _personal_ views, don't you?

So, I'm saying your _personal_ view on this is B.S. Who elses view would I
be talking about?

: >What's your convoluted notion of an Image Processor? Only greyscale? B.S.

: The most important thing is _IMHO_ the capability to define your own general
: convolution filters. Of course the 3x3 filters in MGIF is a bit too small,
: but 5x5 or 7x7 filters would be _sloooow_ without DSP help.
: _I'd_ be unhappy if there was no median filter or some general 'despeckle'
: like functions.

I guess you don't understand the concept of Filtering, do you. Pick up a
copy of Graphics Gems III and look at the article on filtering. With
filtering, you can remove noise (like median filters except it's more
customizeable), blur an image, shapen it, or do all kinds of other effects.
They are a continuous function, so they work no matter how the image is scaled.
Convolutions, however, only work on individual pixels (like having a quantized
filter, in SOL's case.) Take, for example the diffusion filter, it is a
quantized filter and acts much the same way as convolutions do.
The sharpening filter is the same way, but has been smoothed for pixel effects
when enlarging the image. You can also read the filtering section in
the manual for other explainations. Filtering is not just for scaling, you
know, it is also used for "convolution"-type effects. Purhaps I'll add
simple convolutions to SOL if people want this effect, it's so much easier to
impliment than Filtering that it wouldn't take to long to add it.
Anyone can Email me if you want to vote.

: SoL (at least up to v3.5) quantizes the image at load time, loosing a _lot_
: of information.

It quantizes JPEGs to 256 colors, yes. If you are in 16 colors, there is
no noticable loss at all. This does have a small effect for other modes,
but not enough to tell while processing. Since filtering is essentially a
variation on averaging anyway, quantized colors get averaged to nearly the
same values as their original counterparts. This is true for most image
processing techniques. Besides, the ONLY images you get loss for is
truecolor images. Most images are palette based, so there is _NO_ loss
from the original image.

In some cases, there is a small loss, you are right, but I don't think it's
enough to notice when your output is palette-based anyway. The only
time it might matter is if your output was 24bit truecolor. Neither
SOL, nor MGIF handles this...

-Stuart

3100. Re: The Truth about MGIF 4.4

Newsgroup: comp.sys.atari.st
Date: 1994-09-01 03:29:31 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <CvFLpn.CHH@beaver.cs.washington.edu>
Source record: 181393

Thanks for your comments, it's good to hear input from someone else besides us. I think this discussion could easily be taken as a fight, but I think it all started because of small claims by unnamed persons about unnamed programs that were not based on fact. I think that's how most of these things get started. Hopefully we have cleared the air and people now have a better idea of what each program can do (and how very similar and different they both are.) I think the main thing I was tring to get across to Johan was that many of the features in MGIF that he implied were unique could also be found in SOL (or GEMview, but more-so in SOL) but in different forms. I guess that's what I felt that it all boiled down to.

Actually, I was calm through the whole thing, exclaimation points do not mean I am yelling. =) It was those sarcastic smilies ";-)" that Johan uses that I found most disturbing...;-)

3101. FS: Atari Master Tracks Pro sequencer

Newsgroup: comp.sys.atari.st
Date: 1994-09-01 03:33:56 UTC
From: mcwilliams@wmich.edu
Message-ID: <1994Aug31.233356.21016@wmichgw>
Source record: 181396

Master Tracks Pro sequencer for the Atari ST. Will run on TOS 1.0 and
up. 64 tracks, linear, has song overview window, piano edit window, controller
data edit windows, Instrument list window (like a track sheet).
This sequencer is very clean, straightforward, and easy to learn. It's
great because the user interface is so easy to get used to and should please
beginners, most mid-level and advanced sequencer gurus. (Ok, so it's not
Cubase or Logic).
Complete with manual. Paid $300 a couple of years ago, asking $75
(includes shipping & COD cost).

Please reply to MCWILLIAMS@WMICH.EDU

3102. Re: The Truth about MGIF 4.4 WAS: GIF & JPEG Viewers

Source record: 181394

David R Burns (dburns@world.std.com) wrote:

: I think you, Stuart, have every right to be proud of SOL, and to clear up
: misuderstandings about its capabilities.

This was my main goal, actually.

: But I think your criticism of
: MGIF casts you in an unflattering light. I'd rather see you speak
: positively about your program without the (apparent) hostility toward
: another author.

True, I got a little carried away, but typing things like:

Does SOL & GEMview do XYZ?

Does SOL & GEMview do ABCDEFG?

Are critisms of SOL and GEMview IMHO, ESPECIALLY when some of these features
ARE in those programs.

I went back and read my response (the one you considerd my "critisism of MGIF"
article) and the only thing I think may be "destructive" critisism is
where I say "Sheer? How boring." That was not nice, I suppose. All
my other comments were supposed to be "contructive" critisism. Remember,
this was not just to talk about MGIFs features, this was also to compare
them to SOL. I hope Johan will see my comments and use them to better
MGIF. I think it has great potential. I certainly have taken Johan's
comments about SOL vs. MGIF to light, and may use them to improve SOL.
You see, hopefully only good can come of this. It mirrors capitalism
(flames to alt.politics.flames) =)

I did say some good stuff like "It's very fast"..."Convolutions are neat"
etc. Go back and look if you want.

Again, sorry if I came across as nasty. If you re-read it knowing
what I have told you now (like I did) you hopefully will get a different
view of it. Maybe I just need to put more smilies in my words. I just
don't say as many sarcastic things, I guess. =) =) =) =O

I have the following original MIDI programs for the Atari ST for sale:

Dr. T's Realtime Sequencer (awesome for industrial, rap and techno)
$30

Dr. T's XOR Universal Patch Editor for almost all MIDI synths - amazing.
$40

Master Tracks Pro - Great professional sequencer.
$20

Sound Designer Sample Editor for most modern samplers
$35

Turbosynth - create patches using synth parameters and generate usable samples
from them. may also use samples as synth waveforms. if you have a year to
blow on easy and wicked programming, this is for you.
$40

All prices in US dollars including shipping.

Yes, I thought so. I followed the thread in N.SUP.RATSOFT and from what
I remember there was an open confession to having found the RATQwk key
easy enough to crack in five minutes.

I doubt it very much - the Calligrapher vector fonts were their won
proprietary standard, and the format wasn't generally released.

> Calligrapher is able to use vector fonts:, Could it use the Calamus
> or Pagestream fonts ? If not do you have any hints'n tips to convert
> them ?

I wish! My old copy of Calligrapher Gold is now gathering dust in a
cupboard in my friend's house, as I gave up using it long ago. If there
was a conversion facility, and if Working Title hadn't dropped support
so quickly, I may still be using it now :-(

Yeah, there was a hell of a storm about that, I remember. The (sealed)
cover said "Free Kick Off 2!", and when you bought it and opened the
seal it turned out that the KO2 offer was if you subscribed for a year -
the disk actually contained a poor PD Space Invaders clone!

Exactly what happened to a friend of mine. It was a partial headcrash,
where a dust particle had found it's way into the sealed mech, and
randomly crashed the drive at different locations. After a short while
this led to a complete headcrash, resulting in a very dead drive which
won't even take a re-format :-(

Hmm, are you sure? Type 1 fonts are hinted, so should render well at
small sizes. I believe all 3 formats are hinted (but incompatibly, so
converting from one format to another will always lose the hinting).

Perhaps you meant Calamus fonts, which I am told render poorly at
small sizes (eg 10pt at 300dpi).

>
>SpeedoGDOS v5 uses all three plus other GDOS fonts.
>That's Write 3 uses Speedo via it's own internal scaler.

NVDI 3 can do Speedo and TrueType (but not Type 1) fonts.

Claus-Dieter Schulz <schulz@kssun7.rus.uni-stuttgart.de> writes:

>Q: Where could I find a good backup program (no or lowcost).

I'll list for you the two I've used over the past five years.

Freely Distributable: Turtle - Nice, fast, works. No compression
and restores can be a pain because no restore
features are present... just file copy from floppy
back to the hard disk. Utilities have been written
to make the restore process easy... but they
still aren't as nice as...

Commercial: Diamond Back II or III: Demos of both are available.
I haven't upgraded from II to III simply because
I haven't had the extra cash. II is really a nice
program and the main difference between II and III
are in the user interface and tape backup. II offers
compression, encryption, Spectre partitions, file
or raw data backups... well, heck... more options
than you can shake a stick at. Get either one... and
you won't be sorry!!!

Good luck... I'm sure you can find it from some importer in Germany.

> But I guess the same thing happens almost everywhere. Sending money abroad IS
> expensive..!). Yes, I like SoL - but I think it's quite a different kind of a

I recently registered Connect 2.46 just by sending real money in an envelope.
The money was between the registration letter and a postcard, that no-one could
see what was inside. Everything went fine and now I'm a registered user.
(And mr. Wander -the programmer- gives very good user support via Net).

A couple of years ago I registered Trapido by sending the money straight to the
authors account (and paying 100FIM extra costs for transfer), and have not
heard anything from the author. :-)

Message to Shareware-programmers:

If you are going to make your program Shareware, please include a
possibility to a user to send the money to your address.
If you are afraid of being harassed by all sorts of Gay-postcards or
subscribtions of "Knitting Today"-magazines, - well... isn't it worth
it when you get more registered user from abroad that way?

I have reposted the info from 19th May
---- start included post --
Subject: High res TTmonitor for low cost

Hi
The following Info may be of some interest to other TT owners. I have just
bought a brand new 15 inch monitor which cost just pounds 27.99 + VAT.

It,s a Princeton Model LM-301 the spec is:
max resolution 1664(h) x 1200(v)
video 160MHz 4shades
CRT 15 inch,110 Degree landscape mounted
Phosphor white(p188)
Horiz freq 74.63KHZ
Vert freq 60HZ non-interlaced
The video is of course ECL which matches the output of the atari TT.

The supplier was:
BULL Electrical
250 Portland Road
Hove
BN3 5QT

Tel 0273 203500

A few internal adjustments have to be made so that the display is
stable but that only requires a small insulated screw driver. All the

adjustment points are readily availiable and the display can be adjusted
over the whole of the screen area.

monitor 9 pin D conector Atari TT 15 pin HD D conector
ECL MSB - pin 1 -------- connected to -------- pin 4
ECL LSB* - pin 2 -- connect in parallel with -- pin 15
ECL LSB - pin 3 -- connect in parallel with -- pin 4
-5.2v - pin 4
H Sync - pin 5 -------- connected to -------- pin 13
ECL MSB* - pin 6 -------- connected to -------- pin 15
ground - pin 7 ------------------------------ pin 5
ground - pin 8
V Sync - pin 9 -------- connected to -------- pin 14
pin 9 / connect to pin 10
pin 10 / connect to pin 9

The high density connector is availiable from Maplins.
Part Number JW77J and a trimming tool Part Number BR49D

Truetype specifies that at low resolutions the characters sizes will bloat to retain form so rendering the same text at a lower resolution will screw any line break calculations. It has only postponed the size at which the problem appears and that only a couple
of points. If this is a problem one can usually zoom the working page.

Type1 fonts are expected to scale as accurately as possible independent of the resolution treating all output as arbitrary graphics. At extreme resolutions a glyph may call a PostScript
subroutine to modify the hints, this needs the full interpreter.

Your preference probably depends on your requirements. The TrueType view makes sense in the context of a WYSINWYG (what you see is not what you'll get) WP. Where people prepare the text and
format it at the same time. The Type 1 view, which I prefer, makes more sense for someone who
may have prepared the text in a simple editor and is now wants a screen preview while they compose a page intended for a high or perhaps unknown resolution device.

The question is how well the scaler renders the particular format.

The 5.0b version of Speedo hangs if you ask Outline.PRG to calculate the character widths from
the Utopia-Regular .PFA but will work quite happily with it in .PFB format.

The Adobe Symbol font encoding gets scrambled in the top 96 and Speedo won't even recognise a
Truetype Pi (Symbol, Wingdings) font.

My copies of the Speedo Symbol and More Wingbats fonts have a couple of errors and every so often
the Speedo cache returns the wrong entry.

I 'll be sending properly documented details of my tests and the results to Compo when I have
tried out a few more combination.

My tests were carried out using

Wordflair, Hyperpaint II, EasyDraw and the Papyrus demo.

on a

1040STe with 4mb RAM and a 127Mb HD.
Misc cache 150k
Char Cache 100k
Bitmap cache 0k

Having MiNT running seemed to alleviate some problems but that could be down to changed addresses.

I tried installing 100+ fonts. When Papyrus tried to load the outline font I got the message
need FOLDR100.PRG, System Halted. I then enabled FOLDR100 and the fonts loaded but Papyrus couldn't open any files. I had to reduce the number of fonts to below 50 before Papyrus could
open files.

The above would seem to imply one of them is leaving files open! I'm not sure which.

I would also suggest a new version of Outline.PRG which only checks for unused fonts if the button
is pressed. Waiting five minutes while it checks when all I want to do is go to the options menu
is a pain..

Its a shame Calligrapher doesn't use GDOS!

Hi.

I have this nice 17" Sony Trinitron monitor standing here, waiting to be connected to my Falcon.

The trouble is, I am not very much into monitor signals, and therefore a bit in doubt about what to do with the various signals:

1) The monitor has only one sync connection (not separate h/vsync), so I guess I should connect the Composite Sync/Video signal from the Falcon there. Right ?

2) Should I add some resistors for the R/G/B signals coming from the Falcon ?

OK, that was the Falcon bit...
Then there is the TT.

I have this nice Eizo Flexscan 6500 21" B/W monitor hooked up,- and it works great. However, I know this one is also capable of displaying other resolutions than TT-high, as it also has an analoge input and can sync between 31.5kHz, 48->50 khz, and 64->78kHz. Not to mention, a switch between VGA and "other" and one switch for Analog/Digital.

So, can I just wire the R/G/B signals together into the Video in of the monitor ? Or do I have to add some magic ? (Resistors, diodes ??)

Just hook up one of the colour outputs to the monitor, the other 2 need
to be terminated via a 50 ohm resistor to ground. Be sure to a resistor
for each unused colour output. Then adjust your colour palette to only
use that one colour. You could create a network, using resistors to
create a proper gray signal but it is normally not worth the effort,
particularly when using applications where you control the colour palette.

I would suggest using the green output since that is what the default
palette uses for the desktop colour.

First, try booting from a floppy with no hard drive, and playing around for awhile (try to exercise the memory, by running some memory-hungry programs or perhaps RAM testers). If it does not die, it is likely to be something to do with the drive or software. Next, try booting the machine from the hard drive, but with all auto folder programs and ACCs disabled. Play with it again. If it does not die, it is probably software. If you get this far, start looking for something that does not activate right away (a screensaver CPX maybe?).

If it appears to be hardware related, take everything apart, reseat all socketed chips, blow the dust out, unplug and replug cables and connectors, and give it another try. This fixes about 80% of all hardware problems :-). Good luck.

|> daveh@netcom.com (Dave Halliday) writes
|> >What do fellow netters think of Diamond Back? Can it perform the following:

I've been living without a backup on my TT w/ 150 MB of disk for a couple of years now so this year's bogus got invested in an Archive Viper 250 mb backup unit from TOAD plus Diamond Back 3 as the backup software. It is exceptionally easy to use to back up either to floppies or to tape. I highly recommend it. The file-manager-like selection window makes it incredibly easy to select specific files or directories if you want to do just partial backups. It's also easy to just select all the partitions on all your drives and do a full backup. The manual claims to be able to handle typing in atari- or unix-style wildcards but I have not tried this.

The only problem I've had is with the software's built-in compression option. Every tape I write with compression turned on fails the "validate" operation. I can write over the same tapes with compression turned off and all goes well. Since both my drives only fill half the tape, I just don't worry about it. Another nit here is that during the validation phase, the error message telling you that a problem occurred actually writes over the window with the name of the file, making it nearly impossible to determine exactly _what_ files got corrupted. Since I don't do compression any more, though, I don't get the error messages anymore so this is not a big deal to me.

Question: Will gemar or gtar or whatever write tapes which are readable on Suns? I haven't tried bringing any of my DB3 tapes to work to try to read them, but somehow I doubt that they'd make much sense. How about GTAR though? Anyone tried this??

My STFM died the other day. I was mailing as usual and everything just froze so I rebooted and got nothing but a white screen. Even the "quick blink" on the floppy drive didn't occur.

The FM had an xtra ram deluxe board with 4 meg installed. I removed the board and checked with the on-board 512k but that didn't improve things.

Any help would be appreciated....

After all it doesn't cost anything to try either of them out.

>I am yelling. =) It was those sarcastic smilies ";-)" that Johan uses that
>I found most disturbing...;-)

I don't normally use that smiley to signal sarcasm, it's the one I use the
most, by far. My smileys should normally be interpreted something like the
following:

:-) 'Great, no?' (or something like that)
As in:
I'll have Checkered Flag for my Jaguar soon. :-)

;-) '...he said with a smile on his lips.' (or thereabout)
As in:
I wish I had a salary like that. ;-)

It happens that I use other smileys, but then I invent them on the fly and
hope others read the expressions the same way I do.

What does your =) mean by the way? It looks like he's drunk to me. ;-)

It's been a long time since I looked at an 'official' smiley list, but I
think I'll stick to mine no matter what other people may interpret them as.
From the posts and letters I read, it looks like many other people are using
them in much the same way I do.

I'm sorry if my conventions caused any confusion.

(I wonder if this'll be the end of the thread. I don't think there are any
more things for either 'side' to clear up now. :-((;-)

I know the interface is very confusing regarding some features, but unless
someone else is willing to write a better one, it'll probably not be changed
in any fundamental ways before v5.0.
I simply don't like programming GUIs. Thanks for the suggestion, though.

>: I think that looks like my _personal_ views, don't you?
>
>So, I'm saying your _personal_ view on this is B.S. Who elses view would I
>be talking about?

OK, you may say that, but it's _my_ view. I'm entitled to it.

>I guess you don't understand the concept of Filtering, do you. Pick up a

I've taken a three week university course in digital image processing, as
well as a number of other courses involving filtering of different kinds.
I understand it!

>copy of Graphics Gems III and look at the article on filtering. With

I've only looked at Graphics Gems I so far. I did not find much of use in
that and haven't looked at any of the other. Perhaps I should.

>filtering, you can remove noise (like median filters except it's more
>customizeable), blur an image, shapen it, or do all kinds of other effects.

Median filter is nonlinear operation. I don't think you'll be able to do as
good a job at single pixel noise removing with any linear filter.
You'll be able to do all kinds of smoothing, but that is not very good for
the kind of noise I was talking about.
For Gaussian noise a lot more can be done with adaptive filters etc.

I agree that your filters are very good at what they do, though. They're
also a lot easier to understand (and design) without a lot of maths.

>the manual for other explainations. Filtering is not just for scaling, you
>know, it is also used for "convolution"-type effects. Purhaps I'll add

Of course. If they could only be completely user defined...

>simple convolutions to SOL if people want this effect, it's so much easier to
>impliment than Filtering that it wouldn't take to long to add it.

No, it can be done in less than ten lines of code, I think.

>processing techniques. Besides, the ONLY images you get loss for is
>truecolor images. Most images are palette based, so there is _NO_ loss
>from the original image.

This is the main difference between MGIF and SoL in my opinion. MGIF only
comes into it's own when you use non-palette based images.
Very few images are palette based from the beginning.

I'd never think of destroying an image I intended to process by converting
it to GIF format.

>In some cases, there is a small loss, you are right, but I don't think it's
>enough to notice when your output is palette-based anyway. The only

In MGIF you don't have to use palette based output.

>time it might matter is if your output was 24bit truecolor. Neither
>SOL, nor MGIF handles this...

Naturally MGIF can save images in 24 bit colour. That's the whole idea!
Both Targa and PPM 24 bit formats are supported.

For some reason, however, the recently released beta version has problems
with this. It tries saves the three colour components, but when the image
is reloaded it's been destroyed.
I checked an older version (94-07-30) and it was OK there, so I guess one
of my recent fixes to the buffer handling screwed things up.
Thanks for pointing out the bug!

3141. 680x0 linux

Newsgroup: comp.sys.atari.st
Date: 1994-09-01 22:23:21 UTC
From: azog@world.std.com
Message-ID: <CvH26y.1M1@world.std.com>
Source record: 181279

I dunno if many people here have tried the 680x0 port of Linux
for the Atari, but I am having some problems with it. I posted
a message to the german newsgroup for this port, since they
seem to be the driving force behind it, but havent gotten
any answers yet.

I downloaded the kernel from
tsx-11.mit.edu://pub/linux/680x0/kernel/atalnxbn.lzh
and followed the readme, which basically says that you need a
RAMdisk image, filesys.new, which I also got. Then you launch
bootstrap.ttp with the options -r filesys.new, and off you
go. But it doesnt work for me.

First, I have a Falcon with 14/16mb and a 68882, the requirements
stated. Next, I tried launching bootstrap from a shell, which
didnt work, as the shell, gulam, didnt seem to pass the command
line arguements, or bootstrap didnt read the command line arguements.

Next, I set my mint.cnf file to have an INIT line:

INIT=bootstra.ttp -kvmlinux -rfilesys.new

I needed to give the filename of the kernel since bootstrap
was not looking in the right place. Now bootstrap is finally
reading the command line options (bootstrap reports the options in the
beginning).

My last problem was that this needs to run in monochrome mode, and
my Falcon was booting in a colour mode, so I used a CPX to set
the NVRAM and have it boot in monochrome.

So now bootstrap is loading the kernel, and seems to be loading
the ramdisk image, but the last thing it does is seemingly to
mount the hard drive, then fails with a panic that it cannot mount
root. Of course, if t is looking to mount my hard drive (the internal
IDE), it will fail, since this is in FAT format, not minix. But
I thought loading the ramdisk image would tell linux to forget about
the hard drive. I really dont wanna change my hard drive to minix,
since in doing so I would lose everything, and Ive no easy way
to backup.

Any ideas?

Thanx

I recently got a new version of a shareware-list; it said that GEM SPOOL was still at version 2.2, so stop searching, you won't find it yet.....

Greetings,

Frits.

3143. Lattice/asm help

Newsgroup: comp.sys.atari.st
Date: 1994-09-01 23:32:47 UTC
From: R.M.Morris@massey.ac.nz
Message-ID: <R.M.Morris.16.2E66649F@massey.ac.nz>
Source record: 181285

Hi!

I have Lattice 5.06.02 and am trying to incorporate some assembly language routines into the c code.

I can't link the two together as I don't have an assembler that saves in a Lattice compatible format (I only have Assempro).

I tried following the manual and still can't get my routines to work - I can get the ones in the manual to work though.

I'm not calling the OS at all and would appreciate any help any1 can give me on this PLEASE.

Thanx.

Richard r.m.morris@massey.ac.nz

I believe STeno can do this (by Gribnif, I believe). There might also be
such an editor on atari.archive.umich.edu in /Editors (check out the
0index file).

3145. ColorVDI.CPX

Newsgroup: comp.sys.atari.st
Date: 1994-09-02 00:04:28 UTC
From: kfason@csn.org
Message-ID: <CvH6vH.Iqy@csn.org>
Source record: 181281

I Use STalker for my terms. RIght now I use it in ST-High. But Lately I've been using it in 16 colors to get ANSI. I changed the Colors in the ColorVDI.CPX so the background is black and the foreground is white. While this is just fine in STalker, its horrible in anything else... What does the CPX save to? I know its not the NEWDESK.INF as Xboot writes over it every time. I also copied the CPX and had one that was normal, and the other with the black and white reversed, but this idea did not work. What do I need to do to have the black and white reversed only when I use STalker.

Would an old Control.ACC do it? As I know it wrote to the Desktop.INF file. I can always rename it...

thanks!

>If it is faulty, you might be better going for a repair, or second hand SM124.
Or get an SVGA. Mine is one of those SVGAs masquerading as a Multiscan,
and it cost less then 200 quid, inc vat. (Masquerading is perhaps the
wrong word, given that it's called a "Samsung _SyncMaster_ 3", but the shop
sold it as an SVGA.

Iain.Laskey@barclays.co.uk writes:

>There is a superb color GEM version with full GFX called GEMhack. It
>really needs an enhanced GFX board, a Falcon or a TT though. Maybe
>it's useable in some ST reses????

GEM NetHack, and no, it doesn't really work in ST resolutions - 80 columns
of text and 16 colours is the minimum.

If someone works out how to force the AES to use a narrow font, and hence
get 80 columns in ST-Low, GEM NetHack will work like a charm.

I have a question, does anyone have an Epson Stylus printer, I'm thinking about getting one, but I want to know how to works with PageStream?

What kind of printers does it emulate?

Thanks.

Get a Hewlet Packard. They work better, have better tech support, and usually are easier to find ink cartridges for. You should be able to find HP's for the same price or cheaper than the Epson. The Stylus is also poorly built (IMHO) and has a reputation around here for breaking down.

Cross-posted to: ny.forsale,nj.forsale,misc.forsale,comp.sys.atari.st,comp.sys.atari.8bit,rec.games.video.marketplace

I have the following Atari ST equipment for sale. I would like
to sell everything together, but would consider serious offers
to break up the systems. I've reduced my asking price to $600
for the entire lot. Game players take note --- there is
gold in the list below!

I *will* accept offers to break up the package.

Atari 1040ST computer system w/mouse (TOS in ROM), loose power
cable but works perfectly (includes built-in 3.5" drive)
Atari 520ST computer system w/mouse (TOS in ROM), works sometimes

2 Atari SC1224 color monitors
Atari SF354 single sided 3.5" disk drive

Supra 30 megabyte fast hard disk with NeoDesk operating system

All power cables, power supplies, and cables are included to
hook up everything.

The following software, all with original disks, boxes, and manuals:
Word Writer 2.0 Timeworks (barely used)
Timeworks Desktop publishing Timeworks (with bound manuals, never used)
Crazy Cars Titus
International Soccer Microdeal
Wizards Crown SSI
Questron II SSI
Heroes of the Lance SSI
SDI Cinemaware Interactive Movie
TetraQuest Microdeal
Prime Time First Row Software
Starglider Rainbird
Starglider II Rainbird
F15 Strike Eagle Microprose
Rings of Zilfin SSI
Speed Buggy Data East
Typhoon Thompson Broderbund
Guild of Thieves Rainbird
Outrun Sega
Captain Blood Mindscape, Inc.
Road Runner Mindscape, Inc.
Road Wars Electronic Arts
Obliterator Psygnosis
Sinbad Cinemaware Interactive Movie
Defender of the Crown Cinemaware Interactive Movie

Pinball Wizard Accolade
Bubble Ghost Accolade
Ultima IV Origin Systems (+ cluebook)
Dungeon Master FTL (no box)
Virus Rainbird (no docs)
Moebius Origin Systems (doesn't work)

The following software has original disks and manuals but no boxes:
Aegis Animator/ST Aegis
Impossible Mission 2 Epyx
ST Basic Atari
Flash Antic Software
Block Out California Dreams
SimCity Maxis
High Roller Mindscape
Time Bandit Michtron
Barbarian Psygnosis
Airball MicroDeal
Airball Construction Set MicroDeal
Skyfox EA
Neochrome Painting Program Atari
UMS Rainbird
ST Wars Miles Computing
Chaos Strikes Back FTL
Swiftar Accustar Software, Inc.

Plus dozens of other games (Rogue, Test Drive, Sundog, etc.) with
just original disks (no box or manuals), plus a TON of shareware
on disks, plus old Atari distribution disks (DB master one, megaroids,
languages, etc), plus an entire collection of START disks representing
about twenty issues.

There are also duplicates of some of the software (Dungeon
Master, Time Bandit, etc).

Please call or email if interested!

Best regards,
-JRL

3152. Speed, MiNT/TOS

Newsgroup: comp.sys.atari.st
Date: 1994-09-02 03:23:58 UTC
From: erlingh@nova.pvv.unit.no
Message-ID: <3465se$k3p@ugle.unit.no>
Source record: 181299

OK. I told you I could not feel that the system slowed down much with
the new version of MiNT. Well, in order to "proove" this, I decided to
run all the tests on the system I could think of.
As you can see from the following, the system is infact acting
faster on the average *with mint* than without.
However, a very small amount of CPU speed is lost due to the
pre-emptive multitasking algorithm in MiNT. But as you can see, this
is totally negligible (sp?).

Auto folder during tests:
CACHE90.PRG
FOLDR40.PRG
MACCEL34.PRG
Desk Accessories:
XCONTROL.ACC

In addition comes of course MiNT/Metados as you can see in
the tests.

Ram free: MiNT 18582224 | Lost ram due to buffers in
| MinixFS/ISOfs/RAMfs/fasttext
18950704 Without extra drivers (only cache90.prg)
Ram free: TOS 19104840
19214680 Without extra drivers (only cache90.prg)

From this you can see that MiNT uses 263976 bytes for its' own
purposes. Not bad considering all the work it does...

==========

Disk test:

Copying gemview.246 (as found on the atari Gemini cdrom).

My CD-rom is an appleCD 150 .
(150 k/sec, 380 ms seektime it says on the spec-sheet)

The harddisk I use in the tests, is a Seagate 1201N.
(960 k/sec, 22 ms seektime with ratehd from ICD)
This disk contains both the Minix filesystem and the FAT filesystem
used in the tests.

Note that the ISOfs filesystem I use under MiNT is written by me, and
not generally available (yet).

Copying to/from FAT-partitions always use the same target, in the same
state (fragmentation).

The folder contains 200 files and 24 folders.
It totals to 2002105 bytes.

TOS:
From CD-rom to FAT-partition: Metados 2.4
After 5 minutes it had only copied 94 files. I did not
want to wait any longer, so I aborted...

From FAT-partition to FAT-partition:
51 sek. 100%
Erasing on FAT-partition:
22 sek. 100%

MiNT 1.11 with MinixFS and ISOfs (CD-rom)

From CD-rom to Minix-partition:
35 sek. (!!!) xxx% (FAST !!!)
From Minix-partition to Minix-partition:
30 sek. 170%
From CD-rom to FAT-partition:
61 sek. 84% (Indeed !)
From FAT-partition to FAT-partition:
61 sek. 84%

:
: I recently registered Connect 2.46 just by sending real money in an envelope.
: The money was between the registration letter and a postcard, that no-one could
: see what was inside. Everything went fine and now I'm a registered user.
: (And mr. Wander -the programmer- gives very good user support via Net).

Actually, I have registered a lot of foreign users who sent me cash bills in their own currency. I can exchange most stable currencies with only about a $5 exchange fee. That's why I say send the equivalent of $30 U.S. funds if you are sending foreign cash. If you send anything other than cash (unless in U.S. funds, of course), I will probably send it back to you because checks and other things can have fees as much as $25!

So, I'd say the best thing to do is either send cash bills in your foreign currency, or send check, money order, or cash in U.S. currency.

I think most Shareware authors in the U.S. will be able to process foreign cash at their banks like I do. I've found that once you register enough foreign users, they will trust that you won't abandon them and word gets around. I think this is the best way to register foreign users.

Topic: desperate former 130 XE user needs help!!!

Earlier this year, some demented burglar mistook my 130XE for my Jaguar
(which my drughead brother later stole). While I can use a friend's
XE-GS
to access the smaller stuff, I can't get to the Atariwiter+(130XE) files
that are 30-40k long. I am looking for someone with the ST/XE adapter
(I believe it was called the ST Xformer) cable and a 8-bit drive that
would be willing to convert of my disks over to ST format 3.5", which
a friend of mine (or the person doing the conversion) can then convert
to be read by an IBM-type. The files are the first section of a novel,
which I have neither time nor the stamina to retype or scan here at
school. Please, Obi-wan, you are my only hope!!!

Stanley Bundy (stusbund@eku.edu)
Commonwealth hall Box #541
Eastern Kentucky University
Richmond, KY 40475

Please respond by E-mail or Snailmail. Due to the thefts and school
costs
i no longer have the need to read these boards.

It was none other than "Roland Givan" that wrote on 29 Aug 94 that ,
"G> cheaper. If you are prepared to buy second hand, then a TT can be
"G> *very* cost efective against a Falcon, provided of course you are
"G> after a powerful number cruncher, and aren't too worried about lots
"G> of pretty colours at high resolutions.

Can't argue that even at 32Mhz the TT still outpaces the Falcon (but only
just).However I choose the Falcon primarily for its sound capabilitys and
seldom use TC mode. More important to me was that most of the exciting new
software/hardware is definately more geared to the Falcon and apart from the
case It is for me the more desirable machine.

This is one of the very few articles I copied. I don't have a german
dictionary and I don't intend to buy one. This list is short, easily
scan-able by eye and relevant to computing topics. It is ideal for
someone like me who just wants to run the software.

Thank you very much for posting it.

Actually, I'm finding the discussion between two image-manipulation-system implementors to be extremely informative, and I'd like to see it continued publicly. Stuart just needs to be a little less defensive. ;-) Every piece of complex software attacks a problem from a certain perspective, and will therefore have a mix of strong and weak points. Each can still be extremely good, without diminishing the quality of the other.

After all, who's better qualified to discuss these issues than the guys who wrote the software? (As long as they don't let their egos get in the way. :-) I'd like to see the author of GemView jump in as well.

Hello,

RE: Text Editor Desk Accessory?

The two best text editor desk accessories (IMNSHO) are STeno from Gribnif Software, and EdHack (it's got a new name but I can't think of it) from Clear Thinking Software. Both have their pluses and minuses... and both are commercial products. Unfortunately, both only allow one edit window at a time.

There are several shareware text editors that rival the commercial ones but I'm not sure how well they are currently supported. Try finding a copy of Edith and see if it'll do what you want. If I remember correctly Edith was one of the more impressive shareware text editor Desk Accessories I ever tried.

Last but not necessarily least, you can give the desk accessory version of MicroEmacs that CodeHead Software released a couple of years ago. It can be very memory hungry but with tools like MultiDesk or Geneva (where desk accessories can be loaded and dumped at will) it isn't so bad... if you can handle Emacs.

I accidentally spilled pop on my 1040 ST...99.9% landed on the numeric keypad and the arrow keys keypad...anyway, I took the machine apart, wiped up the pop with wet, soapy Q-tips....let it dry...turned it on...and it worked fine for about 45 minutes before crashing with bombs all the way across the screen.

Since then the machine has been seriously f'ed up. Once or twice I managed to boot up properly, but it was unstable and crashed a few minutes later for no good reason. So then I took the machine ALL the way apart and cleaned up every little spot with rubbing alcohol...but that didn't seem to help.

What could possible be wrong with my system? Is there anyplace/anyone that can fix it? Or should I jut toss it in the garbage??? BTW, I live in Cincinnati.

The TT Fast RAM boards differ in speed. The average board should give
100%, but I found large variations between TTs.

>ROM Access: 1.845 75% 76%(I whonder why...)

I wonder why too. Is this consistent?

The ROM test in GEMBench is written in DevPac assembler as a BASIC
library. BASIC first finds the ROM address using by reading the pointer

at 0x04f2. It then calls the asm routine which reads longs from the ROM jumping 260 bytes each time. The code does not loop much to avoid caching. The only thing I can think of is that MiNT somehow slows a program reading system memory which I suppose happens in supervisor mode.

Another weekend is approaching fast...and I go home early today. 8)
Actually, I have to grab a train to London, so I can spend the weekend
with Melanie....

So, here's this weeks installment...

By the way...the English version of ST-Guide (ST-Guide 1.0e) was the
most downloaded file from HENSA over the past month. This is the full
English version.... micros/atari/tos/o/o001/stg_e_01.lzh

Anyway, here's the rest...

ATARI NEWS OF THE DAY Updated 02/09/94 @ 1555

Newsletters

Latest releases:-

atari-tos Volume 07 Issue 004 30/08/94

Back copies can be found in the directory "tos/news","mint/news","falcon/news"
Please refer to the file "00readme" in the directory for details of how to
subscribe.

New software for the Atari TOS section

New packages are as follows; type "cd ~/micros/atari/tos/<x>/<code>" to get to
where they are held. <code> is as below and <x> is the first letter of <code>.
EG. For package "m100" you'd "cd ~/micros/atari/tos/m/m100".

Pfx Date Key Details
--- ---- --- -------
o017 01/09/94 S--- GEMVIEW 3.06 Powerful picture viewing/conversion program

o096 31/08/94 ---- ZX-SPECTRUM EMULATOR 2.07 and a brilliant one, too
o097 31/08/94 S--- OMEn 2.50d Open Multitasking Environment Demo
o098 31/08/94 ---- NEODESK 4 DEMO VERSION Excellent desktop replacement
o099 31/08/94 S--- MNILU 1.61 Compile BASIC code, to produce GEMDOS files
o100 31/08/94 S--- MULTI SHEN 1.00 Revert output to other devices
o101 31/08/94 S--- SUPER VIEW 1.12 File viewer...for text, pictures, and sounds
o006 31/08/94 ---- ONE JACK A desktop accessory program launcher
o102 31/08/94 ---- The Groove Analogue Sequencer Simulator
o103 31/08/94 S--- RSCTRANS 1.0 (15.4.94) Translate your RSC files

o086 30/08/94 ---- GNU UTILITIES Make a near enough complete Unix system
o087 30/08/94 ---- GNU GCC REFERENCE CARDS in dvi and tex format
o089 30/08/94 ---- GNU SUPEROPTIMIZER 2.2 shortest instruc sequences for funcs
o088 30/08/94 ---- RCS 5.6 CONFIGURATION FILE

o090 30/08/94 ---- GNU MP Diffs for the MultiPrecision Maths Library
o091 30/08/94 ---- GNU M4 0.5 A simple macro processor...bianries and sources
o092 30/08/94 ---- GNU SCM 4b2 Diffs for this Portable Scheme Interpreter
o093 30/08/94 ---- GNU MORIA 5.22 A Multi-User Dungeon game
o094 30/08/94 ---- GNUKIT Set up a GNU system the easy way

New software for the Atari Falcon section

New packages are as follows; type "cd ~/micros/atari/falcon/<x>/<code>" to get
to where they are held. <code> is as below and <x> is the first letter of <code>
EG. For package "a001" you'd "cd ~/micros/atari/falcon/a/a001".

Pfx Date Key Details
--- ---- --- -------

You should check out Fast Sector Backup. It's really an impressing program, because the compressing is effective and _very_ fast! I think you also will find that it has most of the features Diamond Back has, and in some cases is even better.

Best of all: I think it's shareware, and it works fine on all ST-compatibles.

I think this needs a slight clarification. There are actually two entirely
different versions of Edith:

Edith 1.0: Shareware pre-release. Now freeware.
Edith Professional (1.2 and up): Buyware (NLG 100, approx. 65 US dollars)
Demo of V1.200 available on net.

You probably have residue under several of the chips. You will need to
get an aerosol PC board cleaner (Radio Shack used to sell some) and spray
in and around every chip.

I would also recommend removing, and cleaning anything that is socketed.

Brian

Remember to take all ESD precautions. Good Luck.

Format your Atari disks with the DFORMAT.ACC (diamond format accesory)
(shareware) using the AFE option.

Save the data on these Atari disks

Then use the Apple File Exchange program that came with your Macintosh to
read the disks.

Or get a NULL modem cable and use comms software to port the data across
eg. ZTerm on the Mac and Freeze Dried Terminal on the ST.

(It works I use both methods)

Matthew.

Bull Electrical are on 0273 203500. Unfortunately their advert in the Wireless World in front of me is a full page write-up on their special offer on guided missile control cable - no monitors this month.

BTW, splash out on their wind-up radio and never buy batteries for your FM trannie again, best of British technology, well worth it.

The TT does not only outpace the Falcon "only just".
I have both machines, and the TT is overall doing twice as fast as the
Falcon. Or did you mean that the TT is slightly faster than a Falcon at 32
Mhz ?

Its a case of horses for courses. For you sound was important, as was all
the new hardware and software. For me, TT-Hi res was important (although
even the colour modes are very useful), and speed and memory. So I went
for the TT over the Falcon. OTOH I'm hanging onto an STM to play games ;-)

:-)

I got seriously bored with Frontier after I got stuck at a certain military level and no matter how many planets I photographed etc they just wouldn't promote me again. They told me that the photos were "better than they had hoped for" but didn't give me anything other than some cruddy medal! :)

If anybody's got some "tip" to get promoted very quickly then I'd like to hear about it...

Not aware of a PD program. My mother was long happy with
Compute Your Roots, but apparently (if phone calls and dead letters are
any indication) that program is no longer supported. I am curious about
a British program I see in imported magazines, but am unsure of its
functionality or prospect of support in the U.S. Toad is still selling
Compute Your Roots. Any input here would be most welcome.

3194. Upgrading 520ST memory

Newsgroup: comp.sys.atari.st
Date: 1994-09-03 05:19:42 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <34911e$t5m@mailer.fsu.edu>
Source record: 181243
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a 520STFM that I would like to upgrade to at least 1mb. It has a rev. D motherboard. There is one row of 16 chips on the bottom edge of the board, with another 16 places for chips above them. These have solder filling the holes, but appear to have traces and such going to them.

I found some instructions on a.a.u.e that tell how to upgrade such a machine to 2.5mb using 2 1mb SIPPs and some serious (to me, at least) work. I would be willing to live with just 1mb if it were easier.

So, can I just fill those empty 16 places with chips?

Is it feasible to suck the solder out of those holes and put chips in there? I'm not an experienced solder person, but I'm willing to try if it is a task that one might hope to be successful at :-).

Are there any other steps, or will the machine recognize the additional 512k automagically if I do this?

What is the "piggyback" memory upgrade that I have heard mentioned previously? This seemed to be a popular way to upgrade these machines, but I'm not sure if it is only for going from 1mb to 2mb, or some other combination that won't help me :-).

Any and all help will be greatly appreciated. Thanks in advance.

3195. internal DSDD drive question

Newsgroup: comp.sys.atari.st
Date: 1994-09-03 05:37:39 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <349233$t5m@mailer.fsu.edu>
Source record: 181244
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a 520STFM with a single sided internal floppy (SSDD) drive that I would like to replace with a double sided drive (DSDD). It is the type with the long thin parallelogram-shaped eject button centered underneath the disk hole.

If I were to get an Atari SF314 DSDD external drive (with the same button configuration), could I just pop it out of the external case, stick it into the computer, and have it work as drive A?

Are there any other steps to making the computer recognize such a drive as drive A?

Is there anything that needs to be done for the machine to recognize that a DSDD mechanism has been installed?

Failing this, how hard is it to make the computer think an external drive is drive A? Could I do it with a fancy cable, or do I have to hack on the guts of the machine?

Finally, does anyone happen to have an internal DSDD Atari mechanism lying around? Perhaps a dead 520 or 1040 whose drive still works? I will pay a reasonable price plus shipping. Please email if (by some miracle) you have one available. Thanks in advance for any help.

I'm not sure what the difference between sending money to one's home address and to a post office box (or somesuch) makes; eventually, it gets there. But as to the issue of sending straight cash -- I'm sure we'd all probably appreciate that, since it's a lot more readily usable ... no need to go to the bank or whathaveyou. But a lot of people have their own misgivings about sending cash in the mail ... if it's well concealed, however, it shouldn't really be a problem.

Yes, you can accelerate the Falcon 030 to 40Mhz without problems.

>
>2) Followup to previous subject: does anyone own a German DDD Screen Resolution
>Card..? That thing accelerates F-030 up to 40 MHz (with original CPU), and
>(more important, I think..) raises the bus speed from 16 to 20 MHz. It
Read my article in the next issue of Atari Explorer On-Line. It works, and it
includes another little fan. Not for the CPU, but for the video chip.
You can choose three bus speeds (16, 18, 20MHz), and you can switch the
processor between clock-doubled and normal.

>accelerates DSP and FPU as well, if so wanted. It seems to be a high-end
>graphics enhancer, too (even better than Blow-Up, SB2, etc. ?): e.g. 1024 x 768
>/ 70 hz NI, 800x600x256 70 hz, and so on.
>This little miracle isn't expensive at all - but does it really WORK..?
The version I have doesn not speed up the DSP. In fact, communication between
the CPU and the DSP doesn not work in 20/40 mode. The screen accelerator is
capable of better resolutions than those BlowUp is providing, but the BlowUp
software is much nicer (for instance, SRE seems to take much more memory than
BlowUp, and it doesn't have BlowUp's screen blanker). Unfortunately, when you
install the speed upgrade, BlowUp no longer works, or I would use that instead.

>4) You who have "real" accelerators (w. Fast-RAM, 68040, etc..): will there be
>compatibility problems? How about games (e.g. does Backwards quit working?) ?
Speed resolution enhancer does not have a problem with Backwards. You simply
switch it to 16/16 mode, and you have your old Falcon back. Backward works
normaly from there.

When I had an STe, I used GNU tar on the ST to read tapes that were
written on Suns using tar (or GNU tar) and vice versa.

I don't think that DB3 uses a tar format.

3201. TOS & molecular modelling

Newsgroup: comp.sys.atari.st
Date: 1994-09-03 12:49:51 UTC
From: avesperm@powerup.com.au
Message-ID: <349rdf$1kb@grissom.powerup.com.au>
Source record: 181153

I know there are some molecular modelling programs available for
the Atari. I've used some. Some are good, some not so...

Nevertheless I've just set up a 486 system for a friend, and he
requires one for that. Anybody got any suggestions

Also, anybody _not_ in OZ have TOS 2.05? How does 2.06 compare with it?

Answers on a postcard...

I know of two: Composcript (which is a comercial package which allows postscript files to be converted to print in dot matrix/inkjet printers and, I THINK, provides a preview facility), and Ghostscript which is free (GNU public lisence, etc)

I don't know much about Composcript, I think it's quite expensive (but it's also apparently quite good).

I have Ghostscript (version 2.61) which IMHO is very good BUT (there's always a but isn't there :-[ ) you really need a fair bit of memory (I have 4Mb but I think you can just survive on 2Mb) and a chunk of harddrive space for all the font files. On a standard ST Ghostscript can chug a bit aswell.

Ghostscript can be found on a.a.u.e in gnustuff/tos/ghostscript. You don't need all the font files unless you will be viewing alot of text (if the right font can't be found the default 'ugly' one is used).

Hope this helps,

Have you tried the internal Z-Modem in QuickBBS?

I haven't bought a 28k8 modem yet, but will in the not to far future. So I
can't test for the time being.

You might get the full 3700 Cps but 1800 is very low indeed.

From: osteele@u.washington.edu
Message-ID: <34aaqj$n1k@news.u.washington.edu>
Source record: 181156

I recently got a BSE parallel port hard drive (works on the PC) that connects to a Portfolio. It works fine on the Portfolio but doesn't work when hooked up to a PC. Does anyone have one of these portable hard drives and a Portfolio? If so please e-mail me and let me know if you've gotten it to work on a PC.

Also, is there a Portfolio newsgroup?

Thanks,

Steve

3209. Q: Atari FALCON and SCSI-drives, esp. EMPIRE 1080S!

Newsgroup: comp.sys.atari.st
Date: 1994-09-03 19:59:44 UTC
From: pvaihine@aton.abo.fi
Message-ID: <PVAIHINE.94Sep3215944@aton.abo.fi>
Source record: 181159

I didn't find any group for Falcon so I try here.

I have a friend that has an Atari Falcon and he bought Quantum Empire1080
SCSI-3 Hard disk. The problem is that the controller doesn't find it.

He is trying to connect it via the external cable that has an adapter
that converts it to flat ribbon cable with the 50-pin layout.
An Quantum LPS240S is working on this configuration!

Is there any special things in Falcons SCSI-controller?!

Is it possible to get this drive to work with this computer?

The Empire is 1 Gigabyte hard disk.

I would prefer email because I don't read this newsgroup on regular basis.
However, if I get answers I will post a summary.

I saw one once called Reltree2. It seemed pretty good, though it only
allowed you to start with a single person and then enter direct ancestors
(enter the initial person, then enter ancestors in any order). Don't know
where you'd find it, though.

>Does anybody know if there is a Unix clone to th e Atari ST?

Theres a port of Linux for the Atari and Amiga, termed Linux/68k
but its for Falcon or TT (or 030 and 882 equipped machines).
Ive had mixed success with it:

The latest version is 0.9pl2, which apperently combines both
Atari and Amiga versions, but doesnt seem to work for me. I
am using the bootstrap program from 0.3, but 0.9pl2 locks up.
0.3 works with some oddities for me but doesnt recognize the
Falcons SCSI port

Read maus.os.linux68k which seems to be the home of the ATari
effort (and is also in german)

Well the best way to clean most Electronic Equipment is soap and water...

You srip it all down, please remove PSU and Disk drive, strip keyboard down,
and soak in a bath of warm water and a mild plain liquid detergent..

Then rinse in clean warm water, the dry with light heat, like a airing
cuboard, you can use a hair dryer but only on low and keep it away rom the
plastic...

The airing cuboard is best but do it over a few days....

I have done this many many times with no problems....

The new, high-end document processor, Papyrus 3.52, can also do
continuous spell checking, and it does it in an original way, marking the
words with a zig-zag line under, then you can go back through and
right-click on the words to bring up the selection list.

>If I were to get an Atari SF314 DSDD external drive (with the same button
>configuration), could I just pop it out of the external case, stick it
>into the computer, and have it work as drive A?

Some of those single sided drives have funny connectors, and some times the
cable that is fitted in the ST can be a bit short, you might have to twist
the cable, as their are no standards on witch way the plug goes...

There are no other problems when fitting a DSDD drive.....

1 Technical Info

My email address will change more than once nexttime. Due to this reason I have an alias, pointing to my actual location - and if it's in the MAUS-Net: G.Castan@physik.uni-stuttgart.de

For easy location of this document at servers and mailboxes, I ask for using the following name(s) and saving the ascii AND TeX versions:
FILENAME=
gdosi21e
gdosinf21e (when using UNIX) CR+LF should be used when saving at UNIX-Fileservers too, not just LF

2 Introduction

Actually I'm writing a program, that makes his print-out via GDOS. Looking for printer drivers I faced the problem, that many times no documentation is included to the drivers.

Otherwise it may happen that there are different drivers with the same name.

Here I have briefly collected my experiences with printer drivers.

This collection doesn't generally want to describe coders how to use printer drivers (except to problems not mentioned in literature). And you wont find information about the concept or how to install printer drivers. To get this refer to the list at the end of this FAQ.

What I want to exclaim here is more information about the several drivers:

o Where are the drivers available?
o How to distinguish them?
o What are the problem with them?
o Which drivers can be used for certain printers?

If anybody has more experience or questions, please write me. I will face the work to update this FAQ.

3 Motivation

With GDOS it took me 2 hours of coding, to get the screen-output to the printer in maximum quality. And (almost) with no extra work I get output to printers I even don't know.

I there's anybody who wants to write a program with printing options, should better care of the main job of the programm.

Nobody wants to pay for printer drivers if there's another program that didn't take the coder extra work with such stuff making this program less expensive (and surely better).

The User has - besides the lower price - another advantage. If he uses several programs he need place for the driver and the fonts only one time on the disc.

SpeedoGDOS is available from Atari shops (Atari Competence Center in Germany) now.

The (qualified) feedback to my FAQ has - compared to autumn '92 - raised remarkable. Due to Speedo the interest in GDOS coming from the coders seems to be bigger.

4 Changes

Beginning with release 2.0 I mark the changes in the contents list above. The
'+' means a new chapter/info and a
'*' stands for changed chapters
This chapter will only be used if I have to mention something about the changes S. Damerau of course. Blame me, not Gerd ;-)

To the Changes of Chapter 9 (Programs):

New are: DOE, MIDI File Printer, TRIPLE_D, GRAPH, 7Up, UpToCase, Chemograph Plus, GEM-View, Solutions, BssiChart

5 VDI drivers

In this table I have listed distributor, errors and useable fonts.

5.1 Ink printers

Name	Date	Length	Distributor	Errors	Others		Fonts

PAINTJET	14.08.92	60173	I				SP, OTL
PAINTJET	13.10.91	45934	WT				SP

Note: The drivers named HP_LJET and DESKJET can be used for (HP compatible) ink and laser printers. The difference is in the transfer to the printer: Packed (p.) or not packed (n.p.). 'Delta' means that the data is delta packed.

PAINTJET:
180X180: 2-8 colo(u)rs
90x90: 16 colo(u)rs

MT90 is made by Patrick Dubbrow.

Using ink drivers produces a problem with bitmap fonts. Using 300dpi all is ok. But 360dpi fonts are optimised for best efforts with pin printers having thick pins. Using ink printers makes the fonts look much too thin.

Solution: either use 300 [600, 1200 :-)] or exclusively use vector fonts

5.2 9pin drivers

|_SLM_HS____|17.01.94_|_63663_|_ROM_________|___|_n_|________|LS,_SPD_____|

SLM_HS is a SLM driver for the Falcon (when using the Heatseeker interface)

5.6 Screen drivers

The screen is (if VDI functions are used) seen as an output device just like printer, plotter etc. That's why fonts for the screen can be installed in ASSIGN.SYS just like for printers.

Normally this isn't remarked because the drivers are in ROM. But they can be used like printer drivers.

Note: For system fonts only (like the original ones) non proportional fonts with a 8*8 or 8*16 matrix can be used. That's limited by the AES not VDI.

With newer AES (from 4.0?) it's no problem to use fonts of free choice (Variable AE_FONTID and AE_FONTSIZE in GEM.CNF, see [15]). Coders should make sure their programs can take that. (even like scrollbars of free width)

Bitmap fonts not assigned for screen driver 1 are not available for other screen drivers.

5.6.1 LineA

The so-called LineA-routines are subprograms of the screen drivers from the ST series, to bee seen undocumented. This is the hardware depending part of the drivers.

The attentive readers discovers it: Exchanging the drivers removes the LinaA routines too. As happened with the TT for example.

So never use them!

/Reading/ acces can be taken to the LinaA-variables. But Why?

5.6.2 Setscreen & Getscreen

These XBIOS-Functions (mostly Setscreen) should'nt be used.

But what am I talking. For those useing them or those being tortured because someone did it:

The video hardware of 1040STE and Mega STE has an hardware bug. When defining a new physbase with Setscreen (and if it's the same gotten with Getscreen), it may happen that the screen is 'folded'. This happens due to the movement of a register at a special moment, which is only allowed to be moved at special phases of the screen output.

What has to be done?

Users: The programs NVDI and FALT_OFF stop this error. Or give this FAQ to coder.

Coders: Either even don't use Setscreen.
If You use it though: If physbase isn't changed, the value taken

with Getscreen may not be used. Use the
value -1 than physbase!

5.6.3 NVDI and WARP 9

There are two often used programs exchanging the ROM drivers: NVDI and WARP 9 (earlier QuickST). TurboST was distributed by BELA but isn't updated no more.

If these are used once, one will never want to miss them: the Desktop seems to be terribly slow. I will never want to work without NVDI on my Atari. Others say the same about WARP 9.

NVDI uses strongly optimised drivers for the ST and TT resolutions. Sadly I don't know which drivers are used by WARP 9.

NVDI is available from Behne & Behne and contains not only the drivers but a GDOS and a manual describing exactly all VDI calls.

WARP 9 is available from CodeHead.

Due to this NVDI is spread in Germany and WARP 9 in the US

Different to NVDI WARP 9 only speeds up the text output. Grafics stay slow as
before. AND the newest version doesn't work with MultiTOS. It Works on the Falcon too, but I don't know if it supports *all* resolutions there (Like with
Screenblaster, BlowUp030 or others)

5.7 Other drivers

Name	Date	Length	Distributor	Errors		Others	Fonts
				1	2		
META	11.04.89	5644	I			MF	
META	08.10.88	9325	BELA			MF

CYPRESS					MEMORY		
PSCRIPT	14.10.92	33016	WT				
HPGL	08.07.91	48885	ST458				
ZEBRA	07.12.91	45746	WT				
T_OFFICE			wt			98/196dpi	
T_OFFICE			wt			98/196dpi	SPD
IMG-0300			Reschke,wt		n		LS

IMG-0300 can be copied (non commercial). The other IMG-0??? drivers are by SciLab. ZEBRA is for the Zebra Labelprinter.

5.7.1 Memory drivers

A memory driver doesn't do anything else than a screen driver (see [14] and [12]). But the output doesn't get to the screen driver, but in another memory to be influenced there.

The normal v_openwk binding doesn't have all parameters needed to open this driver. If not included to the language this binding must be made by yourself. A listing is found at [14].

The memory driver listed above can b/w output only and has a logical resolution of 300dpi. The (matrix) drivers tested by me have no problems with fonts installed that are for other other drivers. The memory driver should take screen fonts - due to the 300dpi.

Problem could appear because of the aspect ratio (relation of pixel width to height) - normally not similar to the screen resolution.
Due to this circles can be displayed as ellipses.

With NVDI V2.5 or higher output can be made to offscreen bitmaps. There can be
made any GDOS outputs and the result can be copied in the screen windows.

5.7.2 Plotter drivers

A HPGL driver seems to be distributed with the program DATA. On PD disk ST 458 (German PD series) is one too. If I get more about it I'll include this info here.

5.8 What's missing

I don't know drivers using the abilities of the following printers:

[o Canon BJC 600 (I think that should be mentioned too, cos I got one - Stefan)]

6 Errors

Errors in the printers drivers - that I know - are the following:

1 These drivers display Fonts with the attribute 'light'
2 Doesn't work on TT
3 The EXTENDED ENQUIRE FUNCTION (VDI 102, vq_extnd) doesn't give back the parameters as listed in the German 'Profibuch' (Jankowski, Rabich, Reschke - Sybex)
4 Using the attributes 'italic' and 'outlined' the letters of bitmap fonts are cut off on the right side. This error appears independent from other attributes being used.
This error was in the Libraries of the driver sources from Atari and seems to be included in all drivers except to NVDI and SpeedoGDOS.

If theres nothing written about an error I don't know if this error appears or not.

Seems it's no accident, that Xact only uses the attributes 'fat', 'italic' and 'underlined'. (See [14])

Another reason against using 'outlined' is the following:
If You make a driver calculate an outlined font from a normal one it get's 'wider' by two pixels. Due to the reason that a pixel has a width depending to the resolution (other than a fitted font) a text gets different widthes in each resolution. But who wants to have different textformat on different printers? The only way to stop this is letterspacing - typographic 'bullshit'.

7 Fonts

7.1 Bitmap fonts

The fonts used are bitmap fonts in the DR standard format. They have to be saved in Intel format. Motorola format isn't supported by any GDOS.
(See [1] and appendix)

GDOS bitmap fonts have their width information defined in both, screen font and printer fonts. Sadly the designers were a bit too zealous and fitted the width of the sreen fonts to make them look very beautiful. They've done a good job, but they're not similar to the printer fonts and don't allow WYSIWYG. No problem with Speedo fonts.

There are many fonts on the Internet only for the screen and maybe useable for one printer. Everybody using these fonts should know that he can't print documents in an acceptable quality via GDOS.

But in the Atari and former BELA package there are containedthe fonts for all printer drivers in this package (the 360*360dpi fonts are missing in the Atari package). If you have a useable program you can print every document with every driver.

7.2 Vectorfonts

Vector fonts don't use pixels, they are created with algorithms - supported by shapes and hints. These algorithms (see METAFONT for a good example) make the fonts copyrighted like normal programs. (See [21] for this)

7.2.1 FSMGDOS Fonts

The vector fonts with the old FSM-GDOS format are named with OTL.

These fonts and drivers should'nt be used no more and are listed to only for completion of this FAQ.

7.2.2 Bitstream Speedo Fonts

The vector fonts in SpeedoGDOS format are named with SPD.

They are supported by all SpeedoGDOS releases and by NVDI 3.0 or higher.

7.2.3 Type 1 fonts

Type 1 fonts are available for MacIntosh abd MS-DOS/Windows. They only have differences in the internal representation, not in the information.

At least one of these formats is supported by SpeedoGDOS from V5.0a. But I already found some that SpeedoGDOS 5.0a can't display.

7.2.4 TrueType fonts

This format is available for MacIntosh and MS-DOS/Windows too. The MS-DOS format is a superset of the MacIntosh format.

SpeedoGDOS from V5.0a can handle both, no matter if it's for MacIntosh or MS-DOS/Windows.

NVDI from V3.0 will be able to handle it too.

7.3 Comparison of vector formats

(This chapter is to be completed yet)

There's no noncommercial program on any platform that can convert one format into the other. A lot of fonts are only available in one format.

But what makes a conversion so difficult? To ask different: Which informations are stored?

7.3.1 Curves

First the shape of the chars should be saved. But that for many ways are used:
Type 1: Uses cubic Bezier curves
TrueType: Uses square B-splines
Speedo: Uses Bezier curves

(Does anyone know, which order is used by Speedo? Does Speedo 5.0 use several orders? How has v_bez_qual to be set to make an output with v_getoutline and v_bez_fill have the same result as the font engine?)

Square B-splines are much faster than cubic Bezier curves but there for are used about 4 times as much points
[ooh, can anyone make a better translation?]

7.3.2 Hints

The next problem is the display on media with low resolution. For a neutral observer Speedo fonts always look quite good on the screen (well, some fonts are ugly by nature).

But I've found TrueType fonts that look as ugly as nothing else on the screen. For example the two vertical lines of an 'n' are not the same, one is 1 pixel and the other is 2 pixels thick.

The way to prevent those errors are hints. This method is used by Speedo, Type 1 and TrueType (but not by Type 3 and CFN). But hints given by the format don't mean that they're used too!

So, finally: All these three font types can look very good on the screen, Type 3 and CFN can't [ever tried to print CFNs on a printer with less than 360x360dpi?]

7.3.3 Internal resolution

After the problem with low resolution now there's the problem with the high resolution. Even if you think there shouldn't be any; there are!

To display a vector font first an internal system of coordinates has to be selected. CFN has one from 0 to 16 thousand, Type 1 (which was created when there were no high-res printers) one from 0 to thousand. Due to this there are 'corners' visible at large letters or high resolutions (in the professional league). CFN can make the big deal here.

(Which internal resolutions do Speedo, TrueType and OTL have?)

7.3.4 Linear and optical scaling

Do we now have - with the description of the shape, a high internal resolution and the hints - a scalable font? Sure not!

A font being designed for 16pt has a totally different shape as a doubled 8pt fonts (see Knuth: The METAFONT book; Kopka: LaTeX etc.). A well designed font isn't scalable.

In large fonts vertical lines are much thicker than the empty space between them. But this information for optical scaling can be saved in a font too.

So a font, being 20 pixels high on the screen (this is usually a large font) should look different to one being 20 pixels high on a laser printer (this is a small font that should have small vertical lines).

(Which formats do save these informations?
to COMPO and 2B:
If it's saved in Speedo, Type 1 or TrueType: How can I tell SpeedoGDOS or NVDI that a printout has to be downsized in a photomechanical way and has to be scaled different to a font that don't have to be changed?)

8 Printer

Producer	Printer	Drivers Fitting
NEC	P6+,P7+, NECP...	
	P60,P70	NB15_(FX:_:,:NX1000)_
HP	LaserJet_II	HP_LJET
HP	DeskJet,_LaserJet_III,IV	DESKJET_(HP_LJET)
CANON	BJ10E	BJ10
CANON	LBP_4/8	CANONLBP,_LBP
Mannesmann-Tally	MT_90	MT90

Drivers in brackets work but don't use the ability of the printer totally. This means - for 24pin-printers - that these are used in 9pin mode. At HP-compatible Laser- and Ink-printers this means that the data isn't packed though being supported by the printers.

Some Deskjet drivers are told to make problems. In this case try the Laser-jet driver. The printing takes longer then (due to more data) but the problems should be removed then.

The BJ10 drivers use the Proprinter emulation. Don't use them in the epson mode!

The meaning of compatible normally is made by the producers of the compatible printers.

Notes:

o If You don't find your printer in the list and knows a fitting driver, please inform me.
o Try other drivers even if you have found one fitting to your printer.
o Of course the FontGDOS drivers have strong problems with the memory. But the speed of'em is faster than the other (Speedo not considered).

8.1 Marked overview

In the German TOS-Magazin July '92 page 24 contains a list.
If You know about list available europe-/worldwide inform me.

9 Programs

Nowadays it's obvious (but not usual) to use GDOS in every program.

The following list is limited to those using GDOS to print too.

Kind of Program	Program	Distributor	Spd
Chart/Measureanalysis	Xact	SciLab	y
	MM-Graph	Overscan	
	Off-Axis	ByTech	y
	DATA_Professional 4	Ralf Wirtz	
	DPE	MAXON (Special disc)	
	GRAPH	Hans-C Ostendorf (Shareware)	y
	MessPlot (Shareware)	Michael Siek (Shareware)	(y)
	rho-Analyse	rhotron_GmbH	y
Graphics	Xact Draw	SciLab	y
	Kandinsky	U. Rossgoderer (Shareware)	y
	TRIPLE_D	U. Rossgoderer (Postcardware)	y*
	Chagall	Trade-iT	y*
	Easydraw	MIGRAPH	
	TouchUp	MIGRAPH	
	GEM-View	D. Fiebelkorn (Shareware	y*
	CHARLY_IMAGE	Wilhelm_Mikroel.	y*
Spreadsheet	LDW Power Calc 2	MSPI	
	K_Spread_4	Omikron	
	Graal Calc 3	Editions Profil	
	Atari Works	Atari Corp.	y
	OPUS	Doug Harrison (PD)	n
	BASiChart	Dr. Ackermann	y
Text/DTP	Calligrapher	Working Title	
	Wordflair II	H3	
	Timeworks Publisher	GST/H3	
	G&D Text II	Hard & Soft	

Cypress	Sascha L�demann	
Papyrus (Gold) S	R.O.M.	y
Infinity	ByTech GbR

This list is no commercial. I'll include every program I get to know.
(Comment by the Translator: Sorry for mentioning Atari Works three times,
but I wanted to keep the 'Text/DTP' and 'Spreadsheet' Chapters')

Notes:

o Programs listed in the Speedo column with yes* support Speedo but don't
use it - don't output text too.
o 7up only uses non proportional fonts (e.g. Monospace 821 from Speedo)
o Xact can print Speedo fonts without Speedo too.
o FSM-GDOS is included in the Wordflair II package.
o Platon only outputs metafiles via GDOS.
o I didn't make it to print via GDOS in OPUS.
(I've been told, OPUS doesn't chose the fonts it can handle with,
and doesn't print if even one of these fonts is installed. See 7.1 too)
o Programs only printing via device 21 are out! (see 15.2 too)

Kandinsky Version 1.73
ftp.cs.tu-berlin.de pub/atari/Graphic/kand173

10 Utiliies

10.1 fontfix

Problem: The font height is included wrong at some fonts. fontfix discovers this error and corrights it.

In the Internet fontfix can be found here:

ftp.uni-muenster.de /pub/atari/Applications/Dtp/Fonts/Gdos

ftp.cs.tu-berlin.de /pub/atari/utils

10.2 Outline Fonts

Outline Fonts Accessory by CJG

What for: This utility edits the EXTEND.SYS for SpeedoGDOS. This file contains a description of the volume from the Speedo caches, the fonts and the font-sizes. The caches can be saved to disc and loaded again from there too.
A good done program except to the offered cache sizes fitted to FSM-GDOS not Speedo.

Filename: OUTLINE.PRG alias OUTLINE.ACC, 67644 Bytes

Spread with SpeedoGDOS.

(Why doesn't Atari make it to make programs including a display of the version?)

10.3 Printer driver

GDOS Devices Accessory by CJG

What for: To edit the ASSIGN.SYS

Filename: DRIVERS.PRG alias DRIVERS.ACC, 64878 Bytes

Before starting this program it's better to create a backup of the ASSIGN.SYS!
The two reasons are the following:

1. The informations about the bitmap fonts are removed without comment.
2. ASSIGN.SYS is removed by a new one if 'Benutzereigen'-'Hinzufuegen' (in the German release) is selected wihtout any chance to get it back.
(The English Version should have a Dialog like 'Own drivers' 'Add' or similar). To all coders: Don't copy that style!

If this utility should display no drivers sometimes simply start ASSIGN.PRG (see 10.4 ASSIGN)

DRIVERS.PRG/ACC only displays the Speedo drivers of my collection. Does anybody know, how it does this? Even it doesn't display the Filename but a name being included as string in the driver. How does one get there?

10.4 ASSIGN

ASSIGN 1.0a is by Dirk Sabiwalsky (PD).

It tests three things:

o Are there several fonts using the same ID and have different Names
(Typefaces)?
o Are there several fonts using the same ID and the same Pixelheight?
o Are there several fonts with the same name (Typeface) and different
IDs?

10.5 FONTCHK

FONTCHK tests GDOS fonts if they have possible errors.

It's spread with ProList for example.

10.6 FONTCNV

Converts GDOS fonts from Motorola to Intel format.

Comes with ProList too.

10.7 GEMFont

Fonteditor being able to read Signum- and PK (TeX)- Fonts too.

Internet: ftp.tu-clausthal.de:pub/atari/systools/gdos/gemfo120.lzh
Use the chance to get a new unlzh or lhxarc.

10.8 FontMonger

Converter and editor for different vector formats including Speedo. Only
works on IBMs or MAC though.

10.9 Font-ID

Font-ID is a little freeware tool made by Frank Schneider. In a window it
displays the fonts installed with GDOS or SpeedoGDOS including the Font-ID
in different sizes. So you can get an overview when you don't have a program
with font selector/ID display function at the moment.

10.10 X4U

Speedo fonts have much more glyphs than the ones displayed in the ASCII
charset. With this program by Peter Hellinger you can setup, which char is
to be used at which ASCII code. It's distributed by R.O.M.

11 Distribution

11.1 Atari

The drivers named with Atari are availabel from Atari. Send three disks,
Money for shipping and a letter to them and you'll get them with printer
drivers and fonts.

This Package is available at Atari shops too.

No docs but for this price ...
(That's the way in Germany - other countrys may differ!)

11.2 BELA

The fonts named BELA were available from BELA

There were two disks with packed printer drivers and fonts for them.

The fonts DO have the same IDs like the ones from Atari, but the internal font NAME is different. Due to this these fonts are correctly not accepted by some programs if used with Atari fonts.

There's almost no documentation. Not even a hint about the one owning the copyright for the drivers or about the author(s)

One last thing about BELA: R.I.P. ;-)

11.3 FontGDOS

The drivers from this package are really much faster than the former ones. (Only bitmap fonts and graphics are comparable of course)

I didn't have any problem using these with other GDOS versions but you must limit to the old fonts.

FontGDOS is the follower of the Atari GDOS. Mainly it differs with the Bezier function and faster (and color-able) drivers. It's got nothing to do with FSM-GDOS or SpeedoGDOS.

FontGDOS is availabel from several firms which use it for their programs.

11.4 Language

The driver named Language is spread on the language disc of the MegSTE

11.5 Internet

The drivers signed with 'I' are to be found in the Internet.
For example: ftp.cs.tu-berlin.de

11.6 Working Title

The WT drivers are spread with Calligrapher. They are (c)Working Title, the wt driver are licensed by Working Title.

No drivers are on the Calligrapher DEMO-disc. The drivers coming with Calligrapher-lite (15DM) are signed with CL in the tables.

Screen fonts are on both discs.

11.7 XWindows

There are PD Speedo fonts from Bitstream. These can be used with Speedo 4.2.
I
(Gerd) have no problem using them (even the umlauts are correct)

To find them let Archie (see 11.12 FTP) search as follows:
set search sub
prog speedo-

The fonts
font0648.spd -bitstream-charter-medium-r-normal--0-0-0-0-p-0-iso8859-1
font0649.spd -bitstream-charter-medium-i-normal--0-0-0-0-p-0-iso8859-1
font0709.spd -bitstream-charter-bold-r-normal--0-0-0-0-p-0-iso8859-1
font0710.spd -bitstream-charter-bold-i-normal--0-0-0-0-p-0-iso8859-1
font0419.spd -bitstream-courier-medium-r-normal--0-0-0-0-m-0-iso8859-1
font0582.spd -bitstream-courier-medium-i-normal--0-0-0-0-m-0-iso8859-1
font0583.spd -bitstream-courier-bold-r-normal--0-0-0-0-m-0-iso8859-1
font0611.spd -bitstream-courier-bold-i-normal--0-0-0-0-m-0-iso8859-1

11.8 COMPO

COMPO offer two Bitstream Speedo packets with 100 fonts each. One costs
DM99.-
(At your own risk)

11.9 IMG-0300

In the Internet:

ftp.uni-muenster.de /pub/atari/Gdos

11.10 Others

I don't make a choice of drivers. The limit is all of them. The authors (and
users) of the programs are asked now to write me, which GDOS drivers come
with the programs (With information of: Codelenght, Date and known bugs).

11.11 FTP

Many students can get software worldwide via ftp (comment by s.d.: lucky
boy'n girls ...). Prices for steady connections are constant, but
connections between America and Europe have to be paid depending to the
volume of data transferred (comment by s.d.: yuck sorry for THIS
translation)

Please try not to ftp over the Atlantic and use short ways.
Use transferring times not in the time of working at the server ('9 to 5')

Files with known names can be found by Archie.

In Germany:
telnet archie.th-darmstadt.de
login: archie
help

In the US e.g.:
archie.ans.net

Archie will automatically display other archies. use the one thats' closest
to you.

The Archie databases ask about once each month one ftp server after the
other for freely available files

One more small hint: atari.archive.umich.edu ist always totally busy. Not
even mirroring to other servers helps. Better connect to
- amiga.archive.umich.edu or
- msdos.archive.umich.edu
and type cd atari from there.
This computers have the same HD mounted. BUT: First search your own vicinity!

11.12 SciLab

SciLab's GDOS drivers are not mentioned in the driver's tables though they
are very favourite - specially the colour drivers.

These drivers no langer can be ordered without a program. This is due to the
programs that lots of programs have when using the colour drivers. SciLab
would be blamed then.

You only can get these drivers by ordering a program from SciLab or making
the distributor (of the software you use) licensing those drivers. SciLab
always has 'an open ear' for that. Those are especially the Speedo capable
drivers for HP 600dpi and HP 500C/550C.

12 GDOS versions

12.1 The ones from the bones

Atari-GDOS, AMCGDOS, ABCGDOS, NVDI and possibly G+Plus use the same drivers.

12.1.1 Atari-GDOS and AMCGDOS

The Atari-GDOS is the father of each GDOS coming after it. It's most remarkable
character are lots of bugs and it's horrible slow speed. But that's history.

AMCGDOS is faster and has less bugs. But it almost has the same capabilities
and was distributed together with Atari-GDOS.

12.1.2 ABCGDOS

Comes from The Netherlands (I think so) and is almost totally unknown. I
only mentioned it because it's a GDOS.

12.1.3 G+Plus

Does anyone know anything about it?

12.2 One step forward

Even though there was a very good GDOS in NVDI, Atari had an open ear to the
request of users and coders and tried to raise the capabilities of GDOS.

12.2.1 FontGDOS 2.0

This is a GDOS still using bitmap fonts. It uses own drivers and is much
faster than ye ol' Atari-GDOS.

12.2.2 FSMGDOS 3.0

During the development of FontGDOS, Atari created a GDOS that can handle vector fonts (named OTL in this FAQ). So FSMGDOS isn't a follower of FontGDOS, but was developed the same time. FSMGOS practically was ready to be released but due to massive protest by the developers it was cancelled in the last moment. Except to bundles it never has been distributed officially.

12.3 Actual developments

12.3.1 SpeedoGDOS 4.0 and 4.1

Contents:

o Installation program
o Speedo font engine
o 2 Programs to edit ASSIGN.SYS and EXTEND.SYS
o 14 fonts in Speedo-format by Bitstream
The Falcon Speedo (in Germany) comes with 18 fonts now
o 14 Printer drivers
o An installation manual

Outrageous features are:

o Speed
o Not the whole Font-file has to be read (memory saving)
o 16bit fonts (no 256 character limit)

See [4]

The information if it's a Speedo or bitmap font can be found in byte 33 of the Fontname (vqt_name, INQUIRE FACE NAME AND INDEX, VDI 130). zero means bitmap font and one means FSM- or Speedo font.

Some Problems are inportant to be mentioned:

A coder can't find out if a driver can handle Speedo fonts (see last question in 10.3)

Some font IDs are used by bitmap AND Speedo fonts, though different fonts with similar IDs may never be installed the same time.

If you don't take care of this you'll get bombs.

It depends to the user to install the right drivers and fonts. The coder can't help here to stop errors.

The best way is only to install bitmap fonts with the right drivers or to use a Speedo only system.

The monospace font coming with SpeedoGDOS 4.0 has no umlauts (ae, oe, ue ...)

For installation and coding best is to refer to [5-7]
Remember starting NVDI before SpeedoGDOS in the AUTO-Folder!

The ones that bought Speedo got 4.0, the Falcon buyers got 4.1

12.3.2 Speedo 4.2

Now Version 4.2 is available with remarkable bugfixes (See [8]). Speedo 4.2 is (in Germany) available as bundle or update (40.-DM) from R.O.M. SpeedoGDOS 4.1 is still sold by COMPO only

Let's see, what Ulli Ramps has to say:

Huhu! [TM]

The following is a list of changes made to SpeedoGDOS.

1) Line-A - Due to many requests from developers, SpeedoGDOS is now no longer Line-A dependent. All output is done through VDI calls. This was done to make Speedo compatible with various graphics cards, and to make it more multi-tasking-friendly. In addition, users should be able to use various VDI replacements with GDOS.

Another benefit from removing the Line-A dependency is that we no longer have to worry about the scratch buffer used for algorithmic special effects. We have implemented the special effects inside of SpeedoGDOS and the drivers, so that the user/program does not have to worry about the memory needed to accomodate arbitrary sized characters. Unfortunately, this means that old drivers need to be relinked with the new independent library (found in the new driver kit).

There are plusses and minuses of the new implementation of special effects. In many cases, the special effects will be slower. With all previous incarnations of GDOS, you could not use 'bolding' or 'skewing' at non-90 degree rotations; now both of these work at all rotations. On the other hand, 'lightening' used to work at all angles and combinations of effects; now 'bold' mixed with 'lighten' only work at 90 degree rotation angles.

Miscellaneous Note - When using special effects, many applications have a hard time placing the cursor. In both the v_gtext() call and the v_ftext() call, the only cursor compensation to be made is for bolding. Bolding adds the thicken value to the number of pixels of each character. For rotated characters, note that the extra pixels can be considered a vector along the positive x-axis which is rotated at the same angle as the text and added to the advance vector; therefore, the length of the text string should remain the same at any angle. This is true even when SpeedoGDOS generates characters on a scanline basis (when the character does not fit in the character cache), although it does not implement the special effects. Also, applications should watch for the case when they keep track of the cursor position with vqt_advance() or vqt_width(), instead of vqt_extent() or vqt_f_extent(). In versions prior to 4.2, the application could accurately place the cursor by adding two pixels for every outline character and by adding left and right skew offsets for a skewed string. Now these effects are generated by the outline font engine, so the application must either rely on the extent calls or it must inquire for the advance vectors for characters that are skewed and/or outlined separately. For compatibility purposes, it is recommended that the version number of SpeedoGDOS is checked so that programs can handle

both old and new characteristics.

2) Font ID's - Speedo font id's have been promoted to a higher range of ID numbers. This was introduced to avoid conflicts with bitmap fonts and more importantly, with the system font (which conflicted with a variation of Swiss 721). For those applications which use the usual interface with Speedo (i.e. use vqt_name() to find out what the font ID's are), there should be no problem, except if documents have font ID's embedded into formatting information. Of course, all the user has to do is substitute the font. If the application actually goes into the font file header to read the ID, note that we are adding 5000(decimal) to all Speedo font ID's.

3) Printer Driver Incompatibilities - Speedo will now check the printer driver it is trying to load for the '_FSM_HDR' cookie embedded in the driver header information. If GDOS does not find the cookie, it will not allow the loading of any fonts; therefore, you can still use your driver for non-text applications. For future reference, please be sure that the driver header begins on a word boundary for all drivers to be used with this version and any future versions of GDOS.

4) Vst_load_fonts() - We have made two optimizations to the loading of fonts. The first is when a load_font call is made, GDOS checks the date of the extend.sys file to see if it was modified since the last load. A reload used to be mandatory because a bigger scratch buffer might have been required. Since we no longer need a scratch buffer, GDOS only checks to see if a change has been made to the list.

The second change is that GDOS no longer deallocates the global list of fonts if there are no more workstations using GDOS fonts. Therefore, application launches will be faster. On the other hand, the miscellaneous cache never gets cleared of font header information, unless a reboot happens.

5) Memory.sys - The memory driver used to mistakenly open a printer handle.

6) vst_height() - Vst_height used to have a bug in which a maximum point size is reached and then the size begins to shrink. This is fixed.

7) Postscript table - The Postscript table has been fixed (i.e. the indexes were off by 32 for certain Postscript files).

8) Fixed vrt_copyfm() in the drivers.

9) When in 'bicsmode', character 0 was not passed through to the font engine.

10) Negative point and set sizes - The handling of negative point and set sizes has been made consistent with the original handling in FSMGDOS.

11) The handling of fractional setsizes was incorrect in the drivers, and is now fixed.

12) V_ftext() in the drivers can now handle the offsets passed into the ptsin array.

13) Screen drivers can now safely load as device 10.

14) The memory driver can be loaded residently.

15) vqt_devinfo() - Vqt_devinfo() now returns information, whether or not the device has been opened. Furthermore, the device drivers name, found in the driver header, is copied into the ptsout array; the name is 26 bytes long. Note: if the driver is not SpeedoGDOS-compatible, a null string is returned, and if there is an error, a -1 is returned in ptsout[1].

16) vst_width() - A new call has been added to Speedo. The call is similar to vst_height() except that it sets the width. The bindings are identical except that the opcode is 231. Note: As with vst_arbpt() and vst_setsize(), you must call the general call (i.e. vst_arbpt() or vst_height()) before using the width calls (i.e. vst_setsize() and vst_width()). In addition, the general calls always reset the widths.

Miscellaneous Note: Although these have been published before, many requests have come in for the SpeedoGDOS error codes. Here they are:
Code 1 Out of memory
2 File open
3 File read
4 File write
5 Speedo engine error
6 Character too large (not used, defaults to line output)
7 No room for scratch buffer
8 Character cache error
255 Miscellaneous
These errors are placed in the error code address that applications should provide. Note that if you have MultiTOS installed, GDOS will report the error to Salert, the system alert box. A revision of the error handling is overdue, since some of the errors are no longer relevant (e.g. code 6), and error code 5 is returned for the lack of availability for pair and track kerning (in addition to the serious errors).

Well, again a big thank you to Ulli!

Now it's me again:

The Installation program for Speedo 4.2 had a small bug yet. If a NEC P printer is selected, NEC_P.SYS ist written into ASSIGN.SYS. But the distributed driver hat NECP.SYS as filename. R.O.M. fixed that.

12.3.3 Speedo 5.0

SpeedoGDOS 5.0 was developed by COMPO/no!software using the sources by
Atari.
More than Speedo 4.x it can scale TrueType and Type 1 (see 7.2). Price:
DM129.-
(at your own risc)

Now 9 printer drivers are included - the additional ones. Speedo 5.0 is an
upgrade, so you have the other drivers. But: Which are the old divers? The
ones before Speedo 4.1 don't work (and only falcon users have 4.1; the ones
who bought Speedo from COMPO in the beginning only got 4.0)

So I at once printed a text using Speedo 5.0, NECP.SYS (Speedo 4.2) and
ProList. And? Surprise! It works. That's really astounding because ProList
and my own program (see 2) had problems with this driver and Speedo 4.2.

Using the drivers of Speedo 4.0 at least shouldn't work due to the changed
jobs of Speedo 4.2 and the drivers.
(Could anyone test Speedo 4.1 drivers with Speedo 5.0?)

Here's how I think an upgrade works (be careful satire)

==========
User: Dear Mr. Compo [...] but my Speedo 4.0 drivers don't work any more.

COMPO: ... best wishes to your decision ... BUT: Speedo 4.2 isn't an official
release. It's especially made for papyrus and not useful for other
programs. On the other hand...though...seen from a different
point...maybe...possibly...Finally you need the drivers from
Speedo 4.2. But we don't distribute them. Ask R.O.M. about it...

[later]

USER: Dear Mr. R.O.M., ...I'd like to get a downgrade, free of course.

R.O.M.: ...don't work...our own costs...bla...etc...better wait for NVDI
3.0, we certainly can put you on the list.

User: "$&"$/(!&!^#
==========
Well, *I'm* full of anticipation how users that only had Speedo 4.0 will be
able to make prints.

Versions of Speedo 5.0 until now:

5.0a (Aug. 3rd 1994)
First release

5.0b (Aug. 8th 1994)
From now T1 & TT font loading works faster.

Known Bug: After calling vqt_headerinfo() the files arent' closed again.
Whe using programs making this with all fonts there maybe can be no more
filehandles (the amount of them differs from one TOS release to another).

5.0c (Aug. ? 1994)

Now LOWMEM=0 works as stated in the manual.

12.3.4 NVDI up to V2.51

These releases were made of very fast screen drivers and a very fast GDOS. Compared to Atari-GDOS, NVDI had almost no bugs. But there functions weren't almost any more functions.

12.3.5 NVDI 3.0

This will be able to scale Speedo and TrueType fonts and will contain printer drivers.

12.4 Comments

Users and coders should be happy with the speed of development. Even the numbers of font format included in the programs doesn't have anything comparable on any other platform.

The time between the releases of SpeedoGDOS 5.0a to 5.0c - making one think there wasn't much of betatesting - doesn't satisfy a lot but, on the other hand it's nice to see that the competition by NVDI 3.0 makes the developers hurry.

SpeedoGDOS 5.0 creates problems in some applications that worked perfectly with Speedo 4.x. This may be due to the negative handles that 5.0 uses for the new formats. That's not a bug, because one shouldn't calculate with handles. But some apps do it though.

Will SpeedoGDOS 5.0 or NVDI 3.0 be supported by the programs first? With NVDI yet a good coding manual was distributed and I think V3.0 will continue this tradition. COMPO and Atari - on the other hand - make a big secret of how to use their GDOS - when you're not an registered developer (paying a lot of money). Me, as a normal consumer, I have SpeedoGDOS since more than 3 Weeks, registered developers don't have it yet ...
I will support the GDOS that I have a documentation first. Other coders will make it this way to - without an ugly reason. And the users will buy that GDOS that's supported by their programs [right said Stefan]. for me it's great to see, that competition revives the marked and am full of anticipation to see, which documentation comes first.

13 Source

Being a developer it's possible to get an almost complete printer driver in object code. This one only must be fitted to the special printer.

This package is available for GDOS and SpeedoGDOS.

13 Tips'n tricks

13.1 Pixel trash at printing, advice for users

Printing graphics on a NEC P6+ (maybe other printers too) including a lot of black in a line I often had the problem that one line was left out (Speedo-drivers NB15, NECP) or two lines were printed displaced in one line (Speedo-drivers FX80, NX1000).

This happens when printing directly and via CENSPEED. When using VARSPOOL this effect is gone.

VARSPOOL can be found on the driver disk of the NEC-printers.

13.2 NEC P6+

Once in a while a NEC P6+ will get noisy (rrrrrrrrrrraattatatattaa).
When You open the front you'll see a round stick (about 1cm thick).
Put two drops of sewing machine oil on it each year (you'll get it from Mom)

14 Tips'n tricks for coders

Fontsize and Pixelsize

Here are my experiences with GDOS and WYSIWYG. Credits to Ulrich Rossgoderer for confirming these.

It's about the output of vector graphics and text on screen and printer.

The size of text is defined in point and is always the same - independent from the resolution of the output device.

Different are vector graphics: they have to be recalculated in pixels before the output. Should be no problem because when opening a virtual/physical workstation You get the pixel size in micrometers in devParm[3] and devParm[4].

Let's assume the vector graphic is saved internally in micrometers, then the definition points at the output simply have to be divided by devParm[3] or devParm[4] to get the position in pixels. When doing the output in windows an offset has to be added. but thats not relevant here.

So far for the theory being quite simple so to this point (see [3]).
Now for the practice.

As described above we output a text and a border - saved internally as vector graphic. It doesn't matter here if the text is a Speedo or bitmap font. To have a better chance to compare the border exactly surrounds the text.

Doing this I got the following experineces: The text exactly filling the border on the screen (ST-high) is - when printed - much too small compared to the border.

An error in the recalculation of the pixelsize can't be the problem, because I made the printing with the drivers NB15, NECP, FX80, NX1000 and the results are the same.

I have only one explanation for this: The screen driver supposes a different resolution for the pixel size than for the font size.

Two solutions I can offer:

First you can use another pixel size on the screen than the one given from the operating system. After opening the virtual workstation (and ONLY this one!) I calculated

devParm[3] := 282
devParm[4] := 282
and with this parameter I made the recalculation from micrometers in pixels. Now the relation from graphic to text on screen and print-out is exactly the same. But now a DIN A4 page doesn't fit on the screen in it's width. The numbers are found by me the experimental way and possibly can be optimised

Another solution may be this: Use a smaller font size for the screen (and ONLY there!) by multiplicating the size with 72/96. This is simple with Speedo fonts because the size in points can be defined by almost endless values behind the point. Using bitmap fonts this won't work due to not having a screen font in the 72/96ish size for every printer font. (Different to translate this, sorry - SD)

This method surely is to be midified for ST-Mid and other resolutions.

From Wilfried Behne (Half NVDI ...) SpeedoGDOS ignores the devParm[3] and [4] - values of the screen drivers. The values of physical workstations ARE taken.

15.2 Selecting drivers

When testing several GDOS programs I found out, that some coders have problems
with the following reasons:

Users can freely assign drivers in the ASSIGN.SYS.
There may be a setup like

23 FX80.SYS
27 NECP.SYS
28 NB15.SYS
31 META.SYS
61 MEMORY.SYS

How may a coder find out which drivers are installed (and ready)? Even though
there's no Printer 21?
Quite easy: When the program supports printers ALL drivers from 21 to 30 are to
be opened and closed again at once. An installed driver gives back a devicehandle >0 when being opened. vf_devinfo gives back correct values when a driver is opened.

Do the same thing with drivers 61 to 70 when MEMORY drivers are supported.

The ASSIGN.SYS as printed above is very useful. That's because the NEC P printers support all these drivers and print in different resolutions.

17 Miscellaneous

17.1 Critics

17.1.1 Critics to the author

Critics are greatly welcomed. To get more info, send email to:

G.CASTAN@cip.physik.uni-stuttgart.de

Possibly one writing me has already tested two or three drivers.
Please write me if the errors listed above occured or not.

Anybody knowing different driver support addresses, please write me an
email.

17.1.2 Critics to the translator

Hi, this is Stefan writing :-)
The reason why I wrote this translation I can't find in my head ...
Guess it's because Atarians should work together and support each other!
Well, if you wonder about some errors of spelling or syntax remind this:
I learnt English at school for 4 years an after that I kept my knowledge
actual by playing some text adventures and now by reading cs.atari.st and
cs.st.tech and some of the ANet groups
If you find some errors in this translation, please don't send them to Gerd
but
to me:

cookie@cookie.syd.de

Referring to the feedback on this translation there seems to be ANY error in
it.
I didn't get too much email now - and no postcard, so I'll set my address
here too: Stefan Damerau
Bergholm 31
D-24857 Fahrdorf

It would be interesting to me, WHO is happy with this FAQ, so send me
postcards,
discs, books, whatever you want - no bombs please ;-)))

Thank You and have fun and lot's of experience with this FAQ.

Bye
Stefan

17.2 Praise

If this FAQ helped you out of a problem, please write me a postcard in your
next holidays.

Postcards I received yet: 1

17.3 For my support

Due to actual experiences I ask the distributors to switch on verify when
copying update disks.

I only know two distributors not making any problem with this.

Does one of the readers want to code a Speedo font editor? We (Gerd &
Stefan)
offer our time to beta test it ;-)

17.4 Trademarks

This document is full of trademarks, no to be used freely.

17.5 Guarantee

I'll offer no guarantee.

3228. Re: Epson Stylus Printer????

Newsgroup: comp.sys.atari.st
Date: 1994-09-04 10:42:26 UTC
From: Brian@bpwilson.demon.co.uk
Message-ID: <652442204snz@bpwilson.demon.co.uk>
Source record: 181180

In article <345ubk$kda@rigel.infinet.com>
tdcflcn@infinet.com "Tom Chamberlain" writes:

> I have a question, does anyone have an Epson Stylus printer, I'm thinking
> about getting one, but I want to know how to works with PageStream?
>
I own a Stylus 800. It gets medium 'domestic' use by me

It works o.k. with my (early) version of Pagestream. I use the
standard Epson LQ printer driver and 360x180 dpi print
quality is good. However, there's no option to
print at the highest resolution (360x360 dpi).

Setting page size to avoid blank pages is a bit difficult.

Speed is average and unimpressive (despite Epson's early claims).

Printer design is not pretty but is less ugly than a deskjet :-)

The ink is *very* water soluble.

Ink cartidges are now readily available (in the UK) and cheap (8.25
pounds=$12.38 is the cheapest I've found).

Noise levels are low apart from parking the printhead and the numerous
beeps the printer makes.

Prints acceptably on a wide range of papers - I use cheap photocopier
paper with goods results.

Paper handling is good. It seldom screws up or feeds several sheets.

Controls are easy to understand and operate.

My Concerns are ....

The inkjets are not part of the cartridge (hence cartidges cheaper than
for HP printers). However, should they become blocked, you cannot
resolve the problem by replacing the cartridge. I had to return my
first Stylus for this problem :-(

Epson (UK, I guess) were very slow in turning around the printer. In
the end it was down to my supplier (Argos) to replace it out of
goodwill.

When the ink cartridge is empty, the printer stops printing (at the end
of the page) with no prior warning. It's very easy to get caught
without a replacement.

As for emulations, I thought the whole point of being Epson is that you are emulated rather needing to emulate :-) I've found it works well with any Epson or IBM Grpahics printer driver. In graphics mode it works well with all of the LQ drivers, and nearly all of the SQ drivers I've come aross. To quote the manual ....

If a Stylus 800 [printer driver] is not available, choose another ESC/P2 printer driver....from the list below in descending order of priority:

SQ-870/SQ-1170
LQ-870/LQ-1170
LQ-570/LQ-1070
LQ-100

If there are no ESC/P2 [printer drivers] choose an ESC/P [one] ...

SQ-850/SQ-2550
LQ-850+/LQ-1050+
LQ-550/LQ-1010
LQ-500
LQ-2550
LQ-800/LQ-1000
LQ-1500

Hope this is of help.

The feature-rich WYSIWYG wordprocessor Calligrapher features continuous spell
checking. It requires a hard disk and 2.5Mb+ of memory to be worthwhile
though.

From: agrill@wuschel.ka.sub.org
Message-ID: <H.eg.L1foMgs2M7o@wuschel.ka.sub.org>
Source record: 181187

Hello everybody!

I'm looking for a utility that converts DVI files, produced by TeX, into
the GEM-IMG-grafic format.

If anybody knows such a program or, even better, knows where I can get it,
please write a private mail to the address of the signature.

Thanks in advance,
Alexander

There is another emulator called AT Once 386 SX that is made for the MSTe.
I think you'll have to spend a little money on a thing called Speed Bridge
(PLCC to 64-pin DIL adaptor).

The AT Once also offers much greater performance (though it is slow compared
to an ordinary PC).

3235. GCC and the STe...

Newsgroup: comp.sys.atari.st
Date: 1994-09-04 16:13:59 UTC
From: dwallace@wam.umd.edu
Message-ID: <34cro7$l1b@cville-srv.wam.umd.edu>
Source record: 181192

I have recently been trying to get GCC installed on my Atari STe, and have not had much success. I am using v2.5.8, and seem to recall reading a while ago that some recent versions of gcc will only run on a 68030 or higher. Does anyone know if this is the case? If so, what version should I be running on my 68000, and where can I find it (wuarchive seemed to only have 2.5.8). Thanks!

Linux won't ever run on a normal ST because like every Unix it needs a
processor with PMMU, i. e. it needs a 68030 at least.

What compiler and libraries are you using? I see to recall the MiNTlibs
having a rather broken scanf(), which scanw() probably calls at a
lower-level (its been a while since I looked at the curses source).

Dunno if it's fixed yet, but MiNTlib is up to patchlevel 44 on
atari.archive.

scanf() isn't really a good thing to use anyway; it's much safter to
read a character at a time, build it up into a string, and parse that
when the user hits <Return> or whatever.

Wouldn't a 68020 w/ MMU work? All the 68030 is is a '020 with
built in MMU so I don't see why not...

BTW: Is there any 68020 (or even 68010) based accelerators out
available for the MSTe?

>support, etc,etc.??

That's Write 3 supports 3 dictionaries - their supplied one (more on its size later), a user dictionary and a text dictionary. The user dictionary is one you build. The Text dictionary you also build but it is customized per document type whereas the user dictionary is used with all document types.

The supplied dictionary comes not as a single file but as multiple files (file sizes are: 228K, 45K, 4K, and 1K. It is supplied with English and American dictionaries (and maybe some others - I thought French was also available - and maybe another one but I didn't check the original disks) Some of the smaller file sizes have to do with handling some of those English/American differences. It appears to keep suffices and prefixes in a separate file that get applied to the main dictionary entries. It appears to be a very compact dictionary representation. Wayne

>
>Some people say there is very little speed improvement. Is that so?

Nope, the look and feel is definetely much better than without the
accelerator, system speed checks also state the improved performance.
Screen update and program execution are a lot faster. Also the 32 MHz kit
is much cheaper and a minimum 'must' for the Falcon users.

>That was so obvious I didn't even mention it ;-) !

Ofcourse...

3242. Neodesk4/Geneva

Newsgroup: comp.sys.atari.st
Date: 1994-09-04 20:15:59 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <34d9tv$eom@golem.wcc.govt.nz>
Source record: 181198

Well, my Neodesk 4 has turned up (A few days ago whilst I was out-of-country), and it is reasonably improved over the demo although it still has a couple of annoying bits (such as the in-window menubar which restricts me to 2 lines of on-screen icons instead of my usual 3 lines if I want the "options" menu to be available in ST-Medium.)

The desktop-pictures that come with it are pretty terrible, but a quick PI2 easilly fixes that problem! :)

The biggest problem I have with it is the time it takes to load, it seems to have some huge delays after the initial "Neodesk 4" dialog pops up is there a reason for this? Also the time it takes to read all the GDOS fonts in any time I select an option that has font-changing in there somewhere.

The INF_LOAD program crashes Neodesk 4 whenever I try to load my Neodesk v3.03/3.04 information file (DEFAULT.INF), not a _major_ problem as I can just re-do everything from scratch, as would probably be easier with such a huge upgrade! :)

There's also the problem it has with floppy-disks, no sir, it doesn't like 'em! It _could_ be a conflict, in which case, here's what I've got in the AUTO folder:

C:\AUTO*.*

```
PINHEAD .PRG 2560
50HZ60HZ.PRG 512
SUPCLKRD.PRG 4312
EASYBOOT.PRG 9124
POOLFX92.PRG 1815
STE_FIX .PRG 1955
JAR15 .PRG 856
GENEVA .PRG 159743
NEOLOAD3.PRX 8649
NEOLOAD4.PRG 9714
NVDI .PRG 40904
DOUBLE2 .PRG 870
DMIRROR .PRG 26700
MONSTER .PRX 2362
SEBRA .PRX 12015
GBELL .PRX 2873
FONTLOAD.PRX 2679
UIS_III .PRX 31744
SPEED .PRX 2620
SAFEMENU.PRX 2022
DRVIN .PRG 5762
```

MFP .PRG 5108

22 items in 383873 bytes

That's in executing order. It _will_ read floppies to a certain degree, but complains big-time all over the disk! It even does this after exiting to normal-GEM-desk! It's not a Geneva problem (Which is an _amazing_ program I've yet to find any problems with other than the fact I need a better machine so I can run more programs without running out of memory :)

The manuals seem to be pretty good (some more info on exactly how their various formats wrote sectors would be nice, but it hardly matters :), and the installation is a piece of cake.

One thing though, the doc's somewhere say that Neodesk v3.03 won't work with Geneva. I had it working _perfectly_ with it. From memory I just set it up in the default fashion, and everything worked 100%! But, I stuck the v3.04 bits in anyway! :)

One does not need an MMU except to guarantee memory protection (it is highly desired, but not absolutely necessary). Virtual memory on a machine without an MMU is not as safe/guaranteed as on one with (nor as fast, usually), but it is certainly doable. The MMU is a relatively recent development, unlike virtual memory.

I keep hearing about how Unix needs a PMMU, and good memory protection, etc.
But back when I started college (1987) the university had a number of
Tektronics workstations that were based on an '020, and they ran just fine
unless too many users tried to run Smalltalk simultaneously. Are there
other ways to implement the environment required for Unix that might be
overlooked?

I'm not very informed on such things, I'm mostly just curious about how
it might have been done back then.

8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file

- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decomompression program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

Prentice Hall sells Minix for the Atari ST. This is based on Andrew Tannenbaums's book "Operating Systems: Design and Implementation."

Minix is a clone of Unix version 7 (one of the versions before BSD and AT&T went their separate ways). Minix is a teaching OS, so it doesn't have some things that people consider "essential" (TCP/IP, X, multi-threaded file system, complex job scheduler). Of course you get the source (and the book walks you through all of the IBM PC v1.0 source code), so if you don't like it, fix it. Several of these things have been added to the patched 386 version (Minix-386vm), adding them to the 68k versin is an exercise for the reader. :) Almost all the source is C, so the book's description of the IBM PC version isn't wasted. Minix is great if you want to learn Unix internals. I would highly recommend that you also get and read the book.

I ran minix on my Mega 4 ST for several years. It was faster than at least one 386 box running SCO that I had access to. :)

For more information on minix see comp.os.minix.

Where can I get Minix for the ST? And I'm not talking about the source code but the finished program that I can just run on the machine without having knowledge about programming etc.
By the way, are there any other UNIX-like operating systems for the ST?
Thanks.

Hallvard

Just some info on the CWAC file that I aranged to put onto A.A.
in the Archivers directory...

CWAC = Cool Wave Archive Converter.. (ENGLISH)..!!!

It will let you convert for one group of Archive formats to one other,
no need to run it each time for different formats, you give it a list of
formats and away it goes, totaly GEM based program....

Very handy for BBS users and people with lots of different Archive files
on the hard drive...

You will need also these TTP's for the Archive standards,
ARC602/AJR/ZIP26/LZH201L and ZOO2.1..

Big NOTE: only use the USA version of ZOO 2.2, and only LZH201L..

The Author of LZH3101 and the other lower versions, have stuffed up the way
Thomas Questers LZH201L option for setting BasePage, its a pity as you can't
use LZH3101 with CWAC, but can be used for extraction..

I wrote to the Author of LZH3101, about making it compatible with
Thomas Questers LZH201L, but he refuses to change it, this is a shame as its
transperent to the operation of LZH3101 and does not do any harm..

Since my original post, I have had Rainbow TOS (1.4) installed in my computer, and have noticed the enhanced built-in file selector. In my opinion, it is a MAJOR improvement over the selector that TOS 1.0 had.

3253. Error messages.

Newsgroup: comp.sys.atari.st
Date: 1994-09-05 01:52:20 UTC
From: Edward Piecewicz <ed_p@delphi.com>
Message-ID: <BOxTmDU.ed_p@delphi.com>
Source record: 181106

I am aware that when bombs appear on the screen, it means that the computer has crashed and needs to be re-booted.

Does anyone have a list that shows which errors correspond to the number of bombs that appear on screen? For example, I converted a .ZIP file to a .TOS file using ZIP2TOS.PRG, as my computer does not have enough RAM inside it for ST Zip to run properly, and I went through a failed attempt to get 2 megs of RAM installed at the Conn. AtariFest show last weekend, but they did not have a working board which the SIMM modules plugged into.

The .TOS file extracted as it should at the beginning, but after the first 5 files, 2 bombs appeared on screen, then a couple of seconds later, another 9 bombs came up, for a total of 11.

Also, is there a list available that explains what the TOS Error numbers correspond to?

Thanks.

Hello,

If you have a Falcon, TT, or 68020/68030/68040 enhanced system, and
are willing to beta-test the latest version of MasterBrowse in exchange
for a registered version, please contact me. I have received a report
of problems with the Falcon, so I want to a) find out if there is in
fact a problem and b) fix it as soon as possible.

If you are interested, please contact me at:

mforget@worldgate.edmonton.ab.ca

Please DO NOT reply to this message, since I only read news/mail from
this address once a day whereas I check my mail at the above address
several times a day.

Message-ID: <031407PBBFHIDXCEJDWN@ars.ath.forthnet.gr>
Source record: 181115

Hi to all aout there.
I want to ask something from all the programers (I know,many of them
read frequently this newsgroup)
First, PLEEEEAAASE try not to mess around when it is about keyboard
input with ASCII over 128. Here in Greece we need this space to put the
Greek alphabet. We have programs do to that. The problem is that many
good programs (WPs, mostly) by not accepting characters over ASCII 128
are completely USELESS to us. Even PAPYRUS which is a very good program
doesn't handle right the character "�" by converting it into "�". The
result is that we can't write Greek words properly. Please dont push us
towards the PC contemptibles, we like our ATARIs.
Secondly, why aren't they for the ATARI platform business,programs like
FILEMAKER PRO (yes I know it is for the Mac computers) ? I mean why dont
we have a decent general purpose database on which we sould base a
entire company ? The last program I remember of that kind was
Superbase Pro. The interface wasn't so beatiful and for nowdays it is
an OLD program.
Well,thats all I had to say to whom is interested.....
Spiros

I think you hit the nail on the head with your "(apparent)" modifier there. Knowing Stu in person, I can filter what I know of his personality into his messages, which (as you would notice if you also could do that) makes his messages seem much less hostile. His only interest in his posts was constructive analysis of the two programs; but being the way he is, he goes about that in a rather unconventional manner that apparently most people consider to be hostile. I have a feeling he does it that way mostly to give what he says more impact on the reader (in this case Johan).

Dan Aylward
dud@u.washington.edu

P.S. - Stu, I hope I don't offend you with my public assessment of your personality; I guess that sort of thing is a similarly ingrained part of my personality... ;) In any case, my only purpose is to alleviate tense feelings on the net...

For 0.9pl2 you need the 0.9 atari bootstrap program else the thing won't
boot ever. Also the binary of the kernel available doen't work on the
Atari's, it merely locks up the machine. You have to build a version using
the sources then it'll run.

I had that problem too -- apparently it's a conflict with another
program (AUTO or .ACC) as booting 'clean' doesn't do this. However,
the problem I have with TurboGIF is that it does some strange things
to my display (i.e. it will display the picture, but either very
dimly or with the image going from light to dark -- the picture is
normal color on the top or bottom of the image, but gradually gets
darker toward the opposite end of the image. This problem isn't a
conflict with other software because it's even without ANY AUTO
programs or .ACCs that this happens. Yeah, it's fast, but only at
displaying crap! <grin> TurboGIF gets a big thumbs-down from me.

Virtual memory without a PMMU is not possible at all. Linux supports virtual
memory and needs the PMMU. BTW, without virtual memory UNIX on an ST would
be quite useless because 4 MByte of RAM are not enough for Linux.

My sector editor can 8-)

I guess you're mixing up physical and logical sectors here. The Atari
docs seem to be confusing here.

Maybe a recent Spectre version can read Mac harddisks without any
conversion of some sort. I don't know, but I think something
like that long, long ago.

It *should* work, but there is currently no support for anything other
than TT or Falcon, and you need a FPU (68881/68882) too.

There is quite a few around now. I have a Falcon/4/120, and think MintNet
is the best SLIP program to use. It took a while to configure correctly
(at least for me!), but now works really well. There is a few utilities
around; ncftp, inetd, rlogin, etc, and theres more to come. I highly
recommend you to try it out. It requires MiNT, and is available at Atari
archive.

configure the default acc, when bootloading
configure the default path, if you want to load an acc (e.g. C:\ACCS\)
configure the hotkey for unloading an acc
configure the hotkey for loading and running

if you want, ich could post it here, it's a 16KB UUE and even in english

Anyone who has actually used NeST will agree with you, Daron.
Certainly, while I have been connected, I have seen no pirated
software. I cannot see what Rickard thinks he will gain by these
unwarranted accusations, particularly given *his* past record. Does he
really think no-one else from NeST also reads c.s.a.s?

Hmm, white screen seems to indicate that the processor at least clears the videoram after turning the power on (one of the very first things it does after a reboot/startup), so the CPU should be ok. (Or am I wrong here?)

What could be the cause is: one of the three Atari custom chips (Glue, MMU and DMA (are the latter two the right names?)) and the ROM's.
Do you have EPROMS installed? Then you should probably check those.

Has anyone a better clue?

Volker

> be quite useless because 4 MByte of RAM are not enough for Linux.

I'm sorry, but I just don't see why this is true. The memory manager portion of a kernel is just another program, after all. It is true that one cannot have _protected_ memory space without some additional hardware, but given that one does not run programs that will stomp all over someone else's memory (in other words, all programs must request memory via the proper system call, which will work in conjunction with the memory manager) there is no reason why one could not implement virtual memory on any type of processor, period.

An MMU allows an architecture to implement virtual memory in a protected way, so that a rogue program absolutely cannot overrun or modify space outside that which was allocated by the kernel (this assumes no bugs in the kernel, which is a pipe dream if I ever heard one). In other words, an MMU is simply a hardware "memory cop" that allows one to enforce memory restrictions at the process level. Below that level, even the MMU cannot prevent screwups.

One sterling example is MINIX. It implements virtual memory on 8086 processors, and I presume the ST version does the same with the 68000 as well. I shudder to think of how much time I spent in the guts of that memory manager, but I can assure you that there is nothing in there that absolutely depends on an MMU. All virtual memory operations can be implemented with standard C calls (plus a bit of standard assembly, for speed). Can it crash due to unauthorized memory accesses? Hell yes! In fact, my MINIX machine was named "pain" during this project. Did it work? Again, yes (after I got the bugs out of my memory manager modifications, that is...). As long as everything follows the rules, there are no problems with virtual memory in this fashion.

Note that we are quibbling about a semantic issue (what does "virtual memory" imply). I am not trying to advocate any implementation of virtual memory without some hardware means of enforcing memory separation. I'm just saying that it is certainly possible, there are many examples of such, and it can be useful if one is careful with the software being executed.

It does have graphic displays of the various levels of the trees, and it can print these out, and the records. As I've said before, though, it's in need of an upgrade and apparently no longer supported. If anybody knows otherwise, or of a better geneology program, I'd like to hear about it.

F > DRVIN.PRG, MKM II, MACCEL2, UIS III and fontgdos (The other
F > possible problem?). I have one acc active: XCONTROL.ACC.

Frits - the first thing I would do to make sure that it isn't a computer-itself problem would be to try booting from floppy with the hard drive off and try running it that way for awhile to see if it crashes.

Next I would try booting the computer using a floppy with your hard drive software on it to allow it to recognize the drive (I believe you're using AHDI - use the disk you got with the drive to boot with) - this will allow you to gain access to the drive while bypassing all the programs in the hard drive's AUTO folder. This is what I used to do with my old SH204 drive when I got "stuck". Again, let it run awhile and run some programs off the drive to see what happens.

Now go into your AUTO folder on the 'C' drive and disable the programs inside it by changing the suffix to something like .PRX. Reboot the computer, allowing the hard drive to boot itself. See what happens.

If everything's still OK, go back to the "C" AUTO folder and re-enable each program one at a time. Reboot each time you've re-enabled a program.

I have a not-so-funny feeling that it might be FontGDOS - that particular program was always a pig no matter how hard I configured and re-configured it to work with my system. Which is why I went back to regular GDOS for the little that I actually use it for now (mostly for STalker), having now gone the Calamus route for any fancy printing stuff I need. It may be conflicting with other programs for hardware calls (two bombs, if I remember correctly, is a bus error caused by conflicting hardware calls - I'm having the same problems right now using Neodesk4's Recoverable Trash Can, which is why I've reverted to using the original trashcan until I can get Gribnif to sort out what my problem is there......)

Hope this helps.

Ho hum. This isn't exactly on topic, but it's close enough. My current
SO is looking at buying a cheap word processing system, and I figured
that an ST would possibly fit the bill.

The problem is that (a) she'll have to print out from a PC running
Wordperfect, which necessitates transfering text, and secondly she
has to be able to type in french.

Now, I ran a quick check in first word plus, and converting french
characters using the utility 1WP2RTF.TTP converted the text into
RTF quite nicely. The problem is that occasionally this utility
has lost text when I tried to use it (or potentially the brain
dead PC at the other end lost it instead) and secondly, entering
french text into 1WP isn't exactly quick, especially on a medium
res screen. So, could someone recommend a good, cheap (or cheap
to register shareware) word processor which works okay with french
text, and which can talk to PC's without losing the accent information?

Thanks. :)

Hmm. Perhaps you can clear up a point for me; whenever I try to
display a GIF using pchrome, if it's less than 320 pixels wide then
pchrome doesn't ask whether I want to scale or clip, but instead
automatically clips. This makes some GIFs I've got at 200x600 look
really stupid. Is there any way of getting round this? Other than
that, I'd agree, it's a truly superb program. For showing colourful
GIFs on an ST, I haven't seen anything to rival it, although
it _is_ limited to just displaying.

I have a set of backup disks I made several years ago (using Turtle)
just prior to selling my STe. I ftp'ed MTool off the net, but it only
reads standard MS-DOS disks. Has someone hacked MTool, or has some
other piece of software that can be used to access TOS floppy disks
from a UNIX workstation?

Christopher

P.S. The specific workstation is a NeXTstation, however any sofware
which compiles on a BSD based UNIX should be OK.

I think I see what COULD be a problem.

According to what Gribnif suggests in configuring the program,
it's best to run the Neoload program as the LAST program in your
AUTO folder to avoid system conflicts. Especially to run it AFTER
screen accelerators like Warp9 and NVDI.

Try resorting your AUTO folder (using the AUTOSORT program) and
see what happens.

It'll be interesting to see who has the WEIRDEST problem with
Neodesk4 - so far everything on this end has been OK with the
exception of the new Recoverable Trashcan, which gives me two bombs
after undeleting or permanently deleting files (and sometimes kicks
```

Neodesk out of memory!)

... Then I'll make it so simple even a Vulcan can understand.

Hi I have several 4 megabyte memory boards for the 520/1040st(stfm) machines.
These are 4 layer boards that accept either 2 or 4 megabytes of 1megx1 DRAMs.
It attaches by a small template that has to be soldered under the MMU chip
(about 6 solder points) and a plug in board to the shifter chip. Very reliable
and noise free due to the 4 layer design.
Fits in all ST's and gives either 2.5 megs or 4 megs depending on how you
populate the board.
Comes with full documentation.
Price: $25.00
You pay shipping - all funds in $US.

>be quite useless because 4 MByte of RAM are not enough for Linux.

You are probably both right, but you need to define your terms more precisely. There are the protection issues and the virtual memory issues. In terms of virtual memory, there are two models to look at: Swapping and Demand-paging. You cannot do demand-paging without hardware. All modern UNIX variants and most clones use this much more efficient form of virtual memory.

Demand-paging divides the memory up into "chunks" and swaps these chuncks in and out as needed. When a process tries to use a chuck that currently isn't mapped to any real memory, the hardware generates a page-fault, then the memory manager swaps a chunk from some other process to disk, and pulls the current processes chunk ack off the disk again, and maps the virtual chunk to a real chunk of the physical memory.

Swapping was the way earlier systems did virtual memory. This system swaps out an entire process' memory space to disk. This can work without MMU hardware. It's tricky to get fully debugged and slow. It takes careful design to prevent deadly embrace situations but many old OSes used this type of virtual memory.

Finally you get to memory protection. This needs hardawre and there are various types and levels of protection. Even the lowly 68000 CPU has limited memory protection capabilities. This is the supervisor-mode and Bus Error stuff. How these get used depends on the implementation of the glue around the 68K CPU. And in fact with some extra "glue" one could have decent per process protection even on a 68000 based system. On the ST, Atari uses this feature of the 68000 to protect low memory (system variables and vectors). However the ST doesn't provide any means to do per-process protection.

So, in theory, it would be possible to implement a swapping type of virtual memory on the ST with no per-process memory protection (and in fact I've done it). It is impossible to implement a demand-paging type of virtual memory on the ST.

>>> Does anyone know of a word processor or document processor with a
>>> CONTINUOUS SPELLCHECK option, similar to the one featured on Word Writer II.

Le Redacteur (versions 3 and 4 as well as the recent Le Redacteur +) can all
do continuous and multilingual spell checks. Le Redacteur + is particularly
impressive in dealing with the French language and includes a 'syntactic"
checker which beats any grammar checker I've seen so far in any language.

Note 1:

Le Redacteur is a french word processor from ETILDE. I know that it
also exists in English. If you wish, I can forward the ETILDE address in
Toulouse.

Note 2:

Le Redacteur requires (in my opinion) a hard disk and at least 2 MB of RAM to
run in an acceptable way. I've used it on my 1040 STFm with two floppies:
this is just about feasible but not exactly comfortable. I use it more
"seriously" on my TT030/8 with hard drive.

3308. Neodesk 4

Newsgroup: comp.sys.atari.st
Date: 1994-09-05 20:19:31 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <34fugj$8n8@golem.wcc.govt.nz>
Source record: 181065

After much messing around I've located why Neodesk 4 can't access floppy disks properly. It's a conflict between NEOCNTRL (Neo-Desk Control Panel v4.00), and Neodesk 4 itself... Strange but true! The problem is simply resolved by using version 3.xx of the Neo-Desk Control panel, or using X-Control instead (losing the screen-saver function etc. unless you can find replacements :)

It seems that the new Falcon-friendly options don't like standard DS/DD drives or some such thing.... But the only difference between v3.xx and v4.xx of the control panel that I can see is that the color bars go to 255 instead of 15 (for the Falcons true-color mode). Asd this is no use to me (2048STE), v3.xx works fine, and lets me use floppies properly!

To test this problem, just stick the neodesk-4 disk in the drive, and drag the drive A: icon into a hard-drive partition. When Neodesk is counting the files, it will get to about file #9 (out of over 50), and then proceed to generate odd noises from the hard-drive. If you want, try formatting a blank disk and listen to the special effects! :) Just don't do it with anything vital in memory, as it basically locks up!

Also. Be careful with INF_LOAD, it doesn't like trying to transfer some bits of Neodesk v3.xx INF files into Neodesk v4.xx so clicking on too many things & loading things back & forth will crash it, often with quite interesting effects! It does however work, although it's not much use as it doesn't restore a lot of the installed-icon file-paths and other things, but with such a difference, it's best to start from scratch any-way!

3311. DSP MPEG player released

Newsgroup: comp.sys.atari.st
Date: 1994-09-05 21:23:51 UTC
From: mdg@ukc.ac.uk
Message-ID: <10525@gos.ukc.ac.uk>
Source record: 181081

I've just uploaded the first version of my Falcon DSP MPEG player
to the atari archive and to ftp.uni-kl.de. This version is grayscale
only -> you can obtain the full-colour version by sending a eurocheque
(or equivalent) for five pounds to the following address :

Martin Griffiths
77 Stranraer Road
Pennar
Pembroke Dock
Dyfed
SA72 6RZ

The player plays I-frame mpegs at 12-20 frames per second!! Please
SUPPORT this program, the next version is due for release by the end
of the week, it is already 25% faster.

Cheers
Griff

3313. Modem Port vs. Serial Port?????

Newsgroup: comp.sys.atari.st
Date: 1994-09-05 22:10:06 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <17028D555S86.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 181063

Thanks to those who helped me with my questions on how to possibly get America On-Line (or San Jose Mercury News' "Mercury Center") on my STe using Spectre GCR. Everyone said it would be possible to use the SERIAL port of my STe to run a modem when emulating a Macintosh for telecommunications. However, I'm confused: When I use my STe in Atari mode to connect up to GEnie using Flash software, I use the MODEM port. If I were to try to run Mac-only telecommunications software (like America On-Line), do I need to disconnect the modem from the MODEM port and plug into the SERIAL port? If I want to use the modem in Atari mode, must it be plugged into the MODEM port, or will it also work in the SERIAL port when in Atari mode. If I need to go back and forth, are there switches available? I've been out of town and unable to experiment. Any help would be appreciated. Either post your answers on the net or E-mail me, and thanks in advance. ---Mark van Wyk

3315. Mupfel that runs GEM programs??

Newsgroup: comp.sys.atari.st
Date: 1994-09-05 22:15:38 UTC
From: john@albemuth.equinox.gen.nz
Message-ID: <H.ekBL.GSYHQ5ZOt4s@albemuth.equinox.gen.nz>
Source record: 181066

Hi there,

I've been looking at the shell Mupfel that comes with the version
1.99 of Gemini. It seems very nice as a shell but won't run GEM
programs. Is there a version of a later Mupfel like this i.e that is
more POSIX like than the earlier 1.21 version, that will run GEM
programs and also handle Shell scripts with conditional commands etc.

Any advice out there??

Cheers,

>the ST. It is wrtten in DBman. I'm very in pressed with the product and
>he always answered questions on Genie.

I used Generation Gap Plus for a while but was frustrated with its
restrictions (I am doing family trees to track medical inheritances
and it only had room for the fields it intended you to use.) It was
a bare bones genealogy program - with some very strange quirks (It
blew away the database a couple of times - most frustrating.)

Switched to It's All Relative - its an improvement but still has a
long way to go for what I am after. At least I still have the first
trees I entered - so it seems pretty stable. Wayne

3318. USR Courier 28.8 DS on falcon

Newsgroup: comp.sys.atari.st
Date: 1994-09-05 23:39:13 UTC
From: leecl@merlion.singnet.com.sg
Message-ID: <34ga71$ff8@merlion.singnet.com.sg>
Source record: 181071

Can anyone tell me how I can get my Falcon030 to work with USR
Courier 28.8 DS. I could not get DTE above 19200bps. Tried Hsmodem but
it just won't initialise the modem.
I'm running a BBS with Ratsoft and Binkley. Ratsoft is the front end.
Ratsoft has a few pre-config settings in Modem_PS.RST. They don't work
for me and I even tried modifying it. Somehow DTE could not be set
higher then 19200.
I've managed to run the courier 28.8 with other comms programs and had
been able to get 28.8 bps connects but has yet been successful with
upload/downloads.

The following is my entry in MODEM_PS.RST :-

US Robotics Courier HST/Dual Standard,001:19200;ATZ*[OK]ATM0 S0=0 V1
X7*[OK]

[001] /*** Dual Standard ***/
ATZ
AT&A3 &B0 &G0 &H1 &I0 &K1 &M4 &N0 &R2 &S0 &X0 &Y1
ATB0 F1 S15=8 S28=14
AT&W

Binkley setting as follows:-

AutoBaud
;Janusok /ARQ
Janusok /ARQ/Mnp/V32
janusbaud 32767
Baud 19200
;Baud 38200
stlockbaud

I'm using :- Ratsoft ver 2.1, Binkley ver 3.13a
USR Courier v.34 28.8 DS.
(Used At&F1 with &K3 changed to &Ki and &B1 changed to &B0)
HSPD-232 (set to 38400 - couldn't get it higher).
Binkley baud set to 19200 - couldn't get it higher

Best Regards

Hi Gordon,

You could try to get a AY-3-8910 soundchip instead, it's more likely
available and mostly cheaper than the original YM-2149 and it's
functionally the same.

Good luck,
Gert

P.S. You can even 'slaughter' a old MSX or Oric computer, they used the
AY-3-8910 also...

I don't follow the reference to uudecoding speed (why would that make a
difference?), but uploading large hunks of nonreadable data to textual
newsgroups is simply not cool, because some folks have to pay for each byte
(whether is it useful readable information, or not). I am not in that
situation, but I could see being rather pissed if I were. That is one
reason why there are binary groups. This and other proper net behavior is
laid out quite clearly in the net.etiquette documents that most sysadmins
ask their newbie users to read before blundering out onto Usenet and making
asses of themselves.

> But in the future I will be u/l fonts to comp.binaries.atari (or whatever
> it is) just so I dont get so much "advice".

Correcting a breach of net etiquette (one that cost folks personal funds,
at that) could be called "advice", I guess. But, I digress. I have a better
solution: If you email me uuencoded versions of Atari related files, with
a small description, I'll put them on atari.archive.umich.edu for everyone
to get via ftp/email. That is an open invitation to all, BTW.

<GRIN> Ok, now I just HAVE to get that vi tatoo. All those EMACS pansies
will be so jealous....

Seriously, one problem I am having since attaining some familiarity
with vi (and clones) is that it's very difficult to use anything else! It
is not a particular liking for the bizzare user interface, more like the
weird commands are permanently burned into my nervous system... I have to
use vi to a large extent for system work, as it is often all that is available
on half-dead machines, so I guess this is an occupational hazard.
Fortunately, vi exists for every machine known to man (hmmm, rather
suspicious, kind of like an editor virus... :-).

Hey, without vi, we couldn't have "Perform this contorted editing task with
one less keystroke than your opponent" contests, eh?

> like that long, long ago.

True, given that you can get the SCSI device to work on your SCSI bus,
Spectre can see and mount proper HFS and MFS filesystems while in Mac mode.
Removeable media also works fine. Flopticals may not currently work, but
only due to the age of Spectre 3.0 (damn, when is 3.1 going to come out!).
I don't think there _were_ any flopticals when 3.0 was released...

Of course, this only helps if you want to share Mac space. If you want to
have some storage for use by the ST, it would require an ST partition in
addition to a Mac one at minimum, and might not work at all. You can have
a Mac partition follow an ST partition with no problems on the ST, but I'm
not sure a real Mac could then find that partition, as it could get confused
when seeing the ST stuff at the front of the disk. Conversely, I'm not
sure you could have Mac partitions come before ST partitions and have the
ST ones be accessible on the ST. I think it is safe to say that what you
are asking is fairly unusual, so good luck!

It sounds as though you have a MegaSTE, which has three serial ports, marked
MODEM1, MODEM2, and SERIAL2. In this case, MODEM1 is the one that will work
with all ST modem programs and under Spectre. I do not believe Spectre
supports the additional ports. Some older ST telecomm programs don't either,
though you can override this by using the serial cpx module for Xcontrol
(available from atari.archive.umich.edu, and quite cool). Hopefully
the newer version of the Spectre software that is supposed to be coming out
will cure this.

Basically, all STs have MODEM1. A "serial port" is a generic term for any
port that can be used for serial (as opposed to parallel) communications.
Only MegaSTE, TT, and Falcon (I believe) computers have more than one
serial port (technically, the MIDI ports are also serial ports, but I won't
quibble). So, when folks refer to "the serial port", they are probably
talking about MODEM1. In your case, if you hook your modem to MODEM1,
you will be able to use it in both ST and Mac modes without any switching
or configuration changes. However, MODEM1 is restricted to 19200bps (which
is fine for most applications). MODEM2 and SERIAL2 on MSTE/TT can go faster,
if they are not plagued with hardware bugs (many are). Consider them to
be "extra" serial ports. Hope that helps.

I no longer have my manual for Frontier Elite II, it wore out quickly. You would think when you pay $50 for a brand new, complete set copy of a Great game like Elite II, they would make a maual that lasts. Anyhows, the manual is hopeless, so could someone send me a photocopy set of the manual? I need it to play the game. Also, does someone have the Bug Fix or Bug Fixes for Elite II. Please let me know, I'd like to get it.

Please reply in E-Mail because I don't read the Newsgroups regularly. My InterNet Address is: bensmith@teleport.com or call Ben voice anytime at (503)256-9974.

That is primarily because there are 35 licensed (high quality) Type 1
fonts in the package. Quality fonts will always be expensive, alas.

HELP, I have Spectre set up on my hard drive. Now what? where can I get mac files that work with spectre? Can I get them from any BBS, if so how do I download them onto a spectre disk? Also I have a few mac- compressed files *.CIT, or *.SIT (I can't remember which) how do I decompress these? As you can see I'm lost in the dark, but I did get the system/finder to work, a nice little mac welcomes me and I can use the desktop. Is there a Spectre FAQ?

I am using a 4 meg STe with a 30 meg HD and a color monitor. Please let me know if I CAN be helped, as I am going insame :))

boyd@gauss.math.fsu.edu (Mickey Boyd) writes:

>one does not run programs that will stomp all over someone else's memory (in
>other words, all programs must request memory via the proper system call,
>which will work in conjunction with the memory manager) there is no reason
>why one could not implement virtual memory on any type of processor, period.

But this means that each time you want to access a certain block of memory
you have to tell this memory manager about it. What I was thinking of is the
way virtual memory is realized in most (or all?) UNIX ports. Here you simply
request the memory you need and use it if you get it. It's the same like
using virtual memory on TT or Falcon with VRAM or OUTSIDE. All programs
profit from it, not only those who know what special calls to make.

>depends on an MMU. All virtual memory operations can be implemented with
>standard C calls (plus a bit of standard assembly, for speed). Can it

But with "real" virtual memory you don't need special calls at all! Programs
simply don't have to care about any memory manager.

3344. SALE: STF coverdisk backups

Newsgroup: comp.sys.atari.st
Date: 1994-09-06 11:23:21 UTC
From: buxmjp@zippy.dct.ac.uk
Message-ID: <1994Sep6.122321.7104@zippy.dct.ac.uk>
Source record: 181098

When my new hard disk arrives, I will have no use for my backups on floppy. As I am also getting a high density drive, this stack of DDs will be of little use. More than 80 disks, including subscriber disks. Also available ST/Amiga Format 1-13 backups. All disks upto (about) STF 30 are image backups (although the amiga bit on ST/AF probably doesn't work) and most are identical to the distributed disks.

Offers about £20 plus postage. Also available Public Domain magazine and disks. Any offers ?

Hello,
I've got a spare OverscanTT graphickcard for
ATARI-TT series of computers.

It works on ANY TT with some st-memory (you can't have one
without) and what it does it brings up more resolution
to st/tt resolutions... maximum grows from 640*480 to 837*600 or
something very similar... for example in Calamus you're able to
view an A4-page at 100%, and see both edges of paper...

works on normal (ptc) as well as with vga/multisyncs...

Make an offer the best one will winn !!!

(...and get it)

3348. Small requests to S/W devellopers

Newsgroup: comp.sys.atari.st
Date: 1994-09-06 12:01:14 UTC
From: biofotos@ars.ath.forthnet.gr
Message-ID: <23946MOETIXIGIVHBIJ@ars.ath.forthnet.gr>
Source record: 181002

At first I want to thank everybody who responded to my mail. Secondly I want to add some things. Someone told me (sorry I erased accidentally your message after reading it) that I could use as well a Spectre GCR. In this case, unfortunately I have a Falcon (I haven't regretted at all this purchase). Until now I had 2 STs (1 Stfm and an STE 4 MB) and I have used GCR for many years. But now I have a FALCON and a Spectre version for the FALCON as I hear is still far away. Of course I could buy a used ST to run Spectre but in this way I should have to buy a LINK for my HD which is working perfectly via SCSI with my FALCON and.....
My opinion is Apple Computers is not at all superior to our ATARIs. Having seen form the magazines programs like PAPYRUS, CLARITY, MagiC, CALAMUS SL,I wonder why isn't there a strong general purpose database for a company, since today IMO the home computer market is very limited. Instead all the profits are in the business computing area. From all these I conclude that the expansion of ATARI computers is through its establishment into the business computing area.
Eventhough,about spreadsheets I am sorry to admitt that, but there is nothing similar to EXCEL in the ATARI platform.
As I explained, I am a fan of ATARI computers (since 1986), I don't use my computer for music (I am a dentistry student) and I want some cheap and good software. Compairing the price of PAPYRUS and MS WORD 6 I see that perhaps the ATARI wordprocessor (no intention to offend anyone or anything , I just compare things) is overpriced. I understand the differences between thw ATARI market and thw PC market, but look at this way: how many students can buy PAPYRUS (cause it is a hell of a WP) with the price of 130 pounds ? If I want to have a decent output on my printout I have to buy SPEEDO 5 and the story goes on. I have many programs legal and some pirated (cause I can't find them in anyother way here in Greece) I buy 2 ST English magazines per month and all I have cocluded is that in ATARI market we have many - many just good programs but little VERY GOOD ones. I just wonder why ....

Spiros

PS. Please don't flame me. I don't want to attack or insult anything or anyone. I just want things to change a little for the best of all.

Hi,

I am looking for a program (PD or otherwise) which is capable of turning images (eg. Degas, NEO, gif, etc.) in to mono 'clipart'-type format. These normally work by processing the image through 'edge' filters and the like. Any recommendations?

I seem to recall, I think :-), that there was such a package called 'ReTouche' sp(?) that did in fact do the kind of conversion I'm looking for and if so - is it still available?

: > FC> It certainly won't be ST Format, that's for sure.
: > FC> = Frank Charlton : ST Format Software/Hardware Reviewer
: >Biased answer I think ;-)
: Indeed, it was Frank that started the "ST Review gone" misinformation.
: I wonder if it was deliberate?

Sorry, but you are wrong here. Frank Charlton does write for ST Format...but it was not him that started this misinformation....it was the arrogant Clive Parker.

Seems to me that Clive Parker only posts to Usenet to write such things...and then never bothers reading replies to the post. I asked him to write to me...after I read his post on Usenet...but he hasn't.

It is Clive who gives STF a bad name....people like Frank Charlton, are good.

Just my humble opinion...

>I have an Atari to Mac graphics converter program, but my Mac won't read
>the Atari disks. Does anyone have any idea how I can port them over? I
>do have a Golden Image floppy drive that I could hook up, but I'm not sure
>where or how since both pieces of equipment have dissimilar cabling.

Just buy AccessPC for the Mac and use 'standard' DOS formated disks in your ST
to transfer the files (many ST programs will format this way, as will Access
PC, so you should have no problem with that). This arrangement works extremely
well.

BTW 'Graphics Converter' for the Mac will read virtually every Atari graphics
format, even Spectrum files!

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's
'Statistics of Deadly Quarrels'. You've probably never heard of it even though
its relevance to the mess you're in is at least as great as that of Darwin's
'On the Origin of Species,' which you learned about in fourth grade. And that's
because it's so completely terrifying only those 'experts' who are adequately
armoured with preconceived contrary ideas which will enable them to disregard
Richardson's work completely ever get to study it."

> Any Info is welcome....

Gadgets by Small's official customer-service hangout has traditionally been GEnie. In March or April, Dave Small posted a message there saying that 3.1 was done, code-frozen, finished, just-waiting-for-the-manual-to-be-printed. It was the first time he'd posted in about a year. There's been no word from him since, although several people have asked about the status of 3.1 since then.

The Gadgets area on GEnie still has a welcome message asking people to pardon their mess while they prepare for an exciting 1993. It's not an encouraging picture.

Anyone else out there using Xpress? I know they officially no longer support the Atari platform, but I thought we had till next summer before we were fully SOL. I've been getting bombs (usually two) for a while now with it. The reason I ask is that the ST I am using has some intermittent DMA problems that could be the problem.
Also, I asked them once a while back if I could just get the pc software since I already own a data converter. They said no. Anyone know if this is still the case?

>the sources then it'll run.

Ok, this clears up some loose ends I didnt know what to do
with. Where can I get the 0.9 bootstrap? I assume that is also
somewhere in source form.

I need to finish gather some essentials, like gcc, which I assume
resides in the bin tree under 680x0 in tsx-11. I can compile the
0.9pl2 kernel under what I have now, rather than trying to compile
it under MTOS (I tried previously with an even older kernel, 0.2? and
it was a whore)

btw: to all interested in atari linux, Ive gotten a pretty stable
system running on my machine now. I am using the 0.3 bootstrap and
kernel, but have gotten the latest filesystem stuff: root and usr.
The kernel in the root image reports 0.8? Anyways, Ive put together
a document describing the steps I took, would there be any interest
in this file?

Anything that does not require system 7 (most Mac software does not) should
work on the Spectre. Try sumex.stanford.edu for huge quantities of
Mac stuff. As for compressed files, most of the distributions of Mac
archivers come in self-extracting archives, so just grab Stuff It,
Compact Pro, etc. and run them while in Spectre mode. It is often easier
to download them with a Mac program while in Spectre mode, as it will
handle Macbinary conversions and such. Look for Zterm to help you with
this.

Drop-down menu bars "in a window" was a choice we made since we had run
out of regular menu space and because it is part of the new GEM standard
that Atari has introduced in their newer AES versions. While it does
consume some additional window space (enough for the menu bar), it was a
logical choice that is consistent with other Atari applications and with
other platforms.

> The desktop-pictures that come with it are pretty terrible, but a quick
> PI2 easilly fixes that problem! :)

Most of the desktop pictures included were designed for 16 color modes or
better. The built-in NeoDesk routines automatically convert them to work
in lower color modes.

> The biggest problem I have with it is the time it takes to load, it seems
> to have some huge delays after the initial "Neodesk 4" dialog pops up is
> there a reason for this?

There is a brief delay after loading to uncompress the NeoDesk executable
code. This was actually introduced in NeoDesk 3. This makes the
NEODESK.EXE file substancially smaller and actually speeds up loading on
floppy based systems (were uncompressing is faster than loading). NeoDesk
4, however, does have a slightly more efficient compression routine which
takes a little longer than NeoDesk 3 did.

> Also the time it takes to read all the GDOS fonts
> in any time I select an option that has font-changing in there somewhere.

This would occur when you open the Windows Preferences dialog. This is
the way GDOS works. Unlike many programs that force you to wait for all
fonts to be loaded at "loading" time, NeoDesk 4 doesn't load GDOS fonts
until you actually use them.

> The INF_LOAD program crashes Neodesk 4 whenever I try to load my Neodesk

> I've yet to find any problems with other than the fact I need a better
> machine so I can run more programs without running out of memory :)

You have the wrong "drive seek" rate set in the NeoDesk Control Panel.
Click on the floppy icon to change it. Maybe something got garbled during
the .INF file translation.

> The manuals seem to be pretty good (some more info on exactly how their
> various formats wrote sectors would be nice, but it hardly matters :), and

That type of highly technical information is usually not included in our
manuals. However, if you have specific technical question, feel free to
write directly to me. I can look into getting you a good answer. ;-)

> One thing though, the doc's somewhere say that Neodesk v3.03 won't work

> stuck the v3.04 bits in anyway! :)

It is working because you are not autobooting it. Version 3.03 won't
autoboot with Geneva. At least it doesn't on our machines. ;-)

That could cause trouble, but in Steve's case the problem is that he has the wrong "drive seek" rate set. So the system is having trouble reading data from his floppy drives.

> It'll be interesting to see who has the WEIRDEST problem with

H'mm. Sounds like you ran into a TOS bug. Check the "Media Change Bug" section of the manual (there's also mention of this in the Recoverable Trashcan section of the manual). We can do all kinds of neat things in our code, except fix some TOS bugs.

The problem is that your "drive seek" rate is set incorrectly. You can
change it right in the NeoDesk 4 control panel. The NeoDesk 3 version of
the control panel is not designed to be compatible is will most likely
cause nasty system crashes (at unexpected times).

Well, I'm guessing this means you finally got it running (your previous
message said that you could not get it running).

Hi Mike,

Seems that you've gotten a brief streak of bad luck. I talked to Dan (who already got a message from you) and he's taking some steps to insure that your next disk will arrive without problems.

3372. WANTED: GDOS to PC conversion

Newsgroup: comp.sys.atari.st
Date: 1994-09-06 19:12:17 UTC
From: richards@mdd.comm.mot.com
Message-ID: <34ieuh$gdj@yendi.mdd.comm.mot.com>
Source record: 181021

On the off chance that such a beast exists...

Is there any Atari or MS-DOS utility to convert GEM (GDOS) fonts
so that a PC-compatible machine can read them? Even if it's
only to a bit-map format like that used by MS-Draw.

I've designed several fonts using the (excellent) Fontkit, and now
that I've migrated from my (dying) ST to a PC, I'd like to be able
to retain them in some form or another.

Thanks in advance.

HARDWARE____
Atari 1040ST, loose power cable but works perfectly $75
Atari 520ST, works sometimes $25

Each computer includes a mouse and AC power supply. The 1040ST
has a manual as well.

Atari SC1224 color monitor (x2) $80 each
Atari SF354 single sided 3.5" disk drive $30

SOFTWARE____
I'm open to offers (package deals preferred) on the following software.
These all included original disks, boxes, and manuals:

Word Writer 2.0 Timeworks (barely used)
Crazy Cars Titus
International Soccer Microdeal
Wizards Crown SSI
Questron II SSI
Heroes of the Lance SSI
SDI Cinemaware Interactive Movie
TetraQuest Microdeal
Prime Time First Row Software
Starglider Rainbird
Starglider II Rainbird
F15 Strike Eagle Microprose
Rings of Zilfin SSI
Speed Buggy Data East
Typhoon Thompson Broderbund
Guild of Thieves Rainbird
Outrun Sega
Captain Blood Mindscape, Inc.
Road Runner Mindscape, Inc.
Road Wars Electronic Arts
Obliterator Psygnosis
Sinbad Cinemaware Interactive Movie
Defender of the Crown Cinemaware Interactive Movie
Pinball Wizard Accolade
Bubble Ghost Accolade
Ultima IV Origin Systems (+ cluebook)
Virus Rainbird (no docs)
Moebius Origin Systems (doesn't work)

The following software has original disks and manuals:
Aegis Animator/ST Aegis

Impossible Mission 2 Epyx
ST Basic Atari
Flash Antic Software
Block Out California Dreams
SimCity Maxis
High Roller Mindscape
Time Bandit Michtron
Barbarian Psygnosis
Airball MicroDeal
Airball Construction Set MicroDeal
Skyfox EA
Neochrome Painting Program Atari
UMS Rainbird
ST Wars Miles Computing
Swiftar Accustar Software, Inc.

The following software includes just the original disks:
Sundog FTL
Rogue
Test Drive Accolade
Super Cycle
DB Master One/Megaroids
some Atari language disks
about 30 START magazine disks

Best regards,
-JRL

>Are there any other steps, or will the machine recognize the additional
>512k automagically if I do this?

I upgraded my old STFM in exactly this way. I got an upgrade kit, which
had the 16 RAM chips, 16 capacitors and a couple of resistors. I think the
resistors are there so that the extra RAM can be seen, but I remember the
intructions say that some boards have them anyway.

Be warned: desoldering those holes takes a LONG time. So does soldering the
chips in.

>What is the "piggyback" memory upgrade that I have heard mentioned previously?

That might be the upgrades with a socket that sits ontop of the MMU and
Shifter, though this is just a guess.

The TT also has a special button for monochrome use in the control panel,
it then assigns the appropriate color levels to the green output only. It
was meaned to be used with mono VGA monitors so it should work great with
the Eizo. Grey levels do look good on the desktop !

The TT also has another mode called 'Hyper Mono', it can only be used
effectively in TT-Low (320x480 pixels) but then you get 256 real grey
levels, this is something even a Falcon can't beat :-)
Photographic images in grey-scale look fantastic, I use this mode to
preview pictures from my self-made 'true-color' videodigitizer.

So, just connect the green output to the analog video input of the Eizo and
switch the 'big-tube' to Analog, the sync lines probably are already
connected (for mono and color the lines are the same), select monochrome
instead of color in your Colour-Setup of the Control panel and it should

work like a dream...

But they also had a MMU. I am not sure if it was motorola's 68851 or if it
was a MMU specially designed by SUN, but anyway the 68851 is the chip
that got some of its functionality built into the 68030 (not all).

Hey, how about making this an option? I have hard drive space to burn,
and time is money :-). Seriously, I think this would be a good option in
the install program (i.e. to answer the question "Do you want max space
efficiency or fastest harddrive load time", thus allowing floppy and hard
drive users a choice). Alternately, you might consider releasing a "patch"
that uncompresses the .exe file and replaces the loader with one that just
loads. Zoom a zoom zoom.

BTW, while I'm making suggestions, I would really like to seen an option to
check for sufficient space before initiating a copy/move operation (all the
code is there via the "show information" functions, and it could be turned
off via "set preferences"). I don't remember seeing this on the 4.x "new
features" list. This would be really handy when doing a lot of floppy work.

Oh, what the hell. How about caching the floppy FATs to speed up floppy
operations? I really wish ICD would include this with their hard drive
caching routines, as that would be a more logical place. Just enough write
through cache for the current floppy FATs would make a big difference (and
would probably speed up the ability to calculate free space on a floppy,
which would have impact on suggestion 2...).

Hmmm, live video in a corner window would also be quite....ah, never mind :-).
Hey, as far as I'm concerned, anything y'all do to improve upon Neo 3.x
is frosting on a rather large and tasty cake. That is one fine product
there, folks. I suspect I'll find 4.x to be great as well.

Net.folks,

sometimes PC emulation becomes a necessity, and so I'm thinking about
a PC emulator for a TT or Falcon. I'm not up to date about the state
of PC emulation, tough. Is there a decent 386-based emulator around
which runs Windows in bearable speed? Does somebody already have
experience with such an emulator?

Thanks for any help,

Claus

3393. Networking Falcon/ST

Newsgroup: comp.sys.atari.st
Date: 1994-09-07 06:32:12 UTC
From: Graham.Irvine@mettav.exnet.com
Message-ID: <779077918.10@mettav.exnet>
Source record: 181036

I have it in my mind to hook my old STFM onto the Falcon so I can run together and have both of them able to access the programs/data on my harddisk.

I would prefer to avoid tying up the midi ports or the cartridge ports as I have use for them and would really like to make use of the Falcon serial2 (LAN) port perhaps hooking it to the Serial,printer or ASCI ports
of the ST.

Can someone throw some ideas at me as to interesting hardware/software I should be looking at ?

Amongst other things which would no doubt crop up If I got it working I want to be able to use the ST to perform some midi functions along side the Falcon and also use it as a scanning platform to scan in pictures to then use on the Falcon without having to unplug or quit programs on either machine.

Also while on this sort of subject is it possible to have the two machines attatched to the same modem so that I can have the ST (Running MAG!X of course) with Straight fax permanently installed and then be able to run the Falcon as normal ...and operate my mailer software ? I guess I am going to need some 'smart switching box' at best here .. so any ideas
appreaciated with this also.

]
] You have the wrong "drive seek" rate set in the NeoDesk Control Panel.
] Click on the floppy icon to change it. Maybe something got garbled during
] the .INF file translation.

I'm not sure about that (Hmmm... let's see....)

Nope, it wasn't that, all it does is generate the different noises due to
seek speed.

Someone recommended I stick NeoLoad.PRG to the end of the AUTO folder
(i.e. last to execute), and after doing this - the problem went away, so
I presume this is what fixed it! I'm not sure why v3.xx and the
combination of v4.xx and the v3.xx control panel didn't cause any
problems though, but using the 4.xx booter, desktop, and control panel
when the NEOLOAD.PRG booter is the last file in the AUTO folder seems
to work fine!

You want bugs!? Here's what I've found so far :)

Bugs:

VERY quickly returning to the main-menu bar after selecting say, the
"Install Application" function from the "Options" menu will cause the
menu-item list to overwrite the dialog box either merging itself
in-front of & behind (at the same time) of any windows behind it, or
overwriting the dialog whilst it's being drawn causing the dialog to
have a chunk of the menu stuck in it which moves around with the dialog.
It's a lot easier to do this with NVDI loaded due to the dialogs drawing
faster!

In the "Program Information File" "Parameters" dialog, the last line of text
overflows the dialog.

Saving preferences does not save the current file-sorting mode in windows.
(e.g. If saved as "Sort by size" after re-booting it will return to
"Sort by name".)

If a group-window is open & preferences are saved, then re-booting will
cause the group-window to be replaced with the window of the directory
where the .GRP file for the appropriate group is located.
```

If the icons in a group-window are "snapped" then any icons that aren't over-written by the re-ordered icons will not be un-drawn whether or not that icon has been shifted (e.g. PFX-Pack is an icon, it's snapped and is shifted from the middle of the window to the top left. The original icon stays in the middle but it also appears in the top left. The top-left (snapped) icon is the real one, and the original is just an on-screen graphic that is unselectable etc. This is best seen with a lot of icons on the screen. It can also do this on the normal desktop when there are 10+ icons all over the place.

After formatting a disk the info' dialog usually appears, but if after entering the volume-label another disk is formatted the info' dialog doesn't appear afterwards. (Does for the 1st disk but not the 2nd disk etc.) For this to happen the 2nd disk must be formatted without exiting the "Format Disk" dialog and selecting format again.

(Tested in ST-Medium with NVDI v2.50 on a 2meg STE (non-enhanced)).

None of them effect operation too much, mainly just cosmetic, but there you are!

Apart from small glitches which will no doubt be eradicated soon enough, it's a great program!

Hi.

Is anyone out there running MacTCP in Spectre mode?

If so, *please* let me know how it was accomplished.

I'd be interested to hear from any Spectre users, especially anyone
running the Mac emulator on a TT.

I have a 4 meg STFM, TOS 1.2 and Megafile 44.

Cheers,

Hi all

I have been asked to try and find a screensaver that works with Cubase Audio on the Falcon. As far as I know no screen enhancers (NVDI or ScreenBlaster/BlowUp) are being used.

Can anyone suggest one and tell me where I can find it on the net??

Thanks in advance,
Dave

>so can any one help with this Patch...??

Roger,
I don't know exactly what files you have, but I tried Guck out once, and what I found was that the second program in the archive was an installer. You simply put Guck and the installer in whatever directory you want and then run the installer. This installs Guck as the default document (*.*) displayer in your DESKTOP.INF (or NEWDESK.INF, and I think it worked with Neodesk and Gemini too). Perhaps the second program you have is this installer?

Regards,
Tom

It's included in the linux source tree under tools/atari, under the
name bootstrap.c. You should be able to compile it from the toplevel
Makefile by saying `make atari_bootstrap'.

As you said "time is money". It is not as simple as "decompressing the
exe". The method we used (optimized for both speed and the fact that
multiple accesses are made to the exe file for a number of different
purposes, including the Geneve-emulation code and the Icon Editor) is
rather complex and would require substancial additional development to
change (and then keep compatible, imagine trying to support two
versions). We made what we felt was the best choice from what we had to
work with and with the limited development time we had.

> features" list. This would be really handy when doing a lot of floppy work.

This wasn't added due to speed considerations (it is REALLY slow on an
Atari). But we do have the ability to automatically keep in memory the
files that were part of such a copy/move operations (they are placed in
the File Clipboard). This gives you a greater functionality to deal with
this type of problem.

> Oh, what the hell. How about caching the floppy FATs to speed up floppy

> which would have impact on suggestion 2...).

That type of feature isn't in there so that you CAN run external programs
like you describe. ;-)

> Hmmm, live video in a corner window would also be quite....ah, never mind :-).

Actually, with all the hooks into Geneva and NeoDesk 4, someone who write
that would not have to worry about all the windowing code...;-)

There's no special code in the NeoDesk control panel. However it does set
the seek speed. I was able to duplicate your problem (in either NeoDesk 3
or 4) by setting the wrong seek speed. Other than that, we haven't had
any reports of this nature.

> You want bugs!? Here's what I've found so far :)

Just to make myself perfectly clear. I don't want bugs. ;-)

> Bugs:

I'll reply to these in a separate message. I want to talk with the office
and see what we have on these.

This is probably because the market has reversed. It has now become
much more interesting to build an Atari emulator for the (power)
macintoshes than the other way round. That is, IMROFHO. There
aren't many TTs around and who wants to use his old ST to run a very
old version of the Mac system at at very low performance? A Mac at
Falcon price, I expect, would be much quicker.

>programs but little VERY GOOD ones. I just wonder why ....

I think maybe you have answered your own question, Spiros. ;-)

Even in Greece, I'm sure you can still purchase software via mailorder. It may not be as -easy- as stealing, but it's still available. Rampant piracy is not the primary reason for Atari's woes, but it didn't help.

>I don't want to attack or insult anything or anyone.

Then kindly avoid making references to your pirated software, OK? A lot of developers read this newsgroup too, and while we are obviously aware that many users pirate software, we still don't like to read about it.

THANK YOU to those who have made logical (and polite) requests for readers of this newsgroup to follow the rules and not post huge uuencoded files here.

Doing so -is- improper and discourteous to others, especially those who must pay for their Usenet access.

If you have such a file you would like to make available to others, then just post a notice here and upload it to the .binaries or .sources groups, or else simply email it to those that request it.

A little courtesy and cooperation goes a long way...

Cheers,

-Hutch- @ Fair Dinkum Tech

Again, I'd say try out Marcel before before buying a commercial package. I've heard it's really easy to access international characters with this program, though I've personally only briefly looked at it. (I didn't like its looks, but it seemed a very capable shareware package. I'm just too fond of WordWriter :)

All the best

Source record: 180964

Thanks to everyone who were helped me with my questions about getting Spectre GCR to drive my Atari modem on a Mega STe. I got the America On Line (or more specifically, Mercury Center) software to work on my Mega STe in the Mac mode using Spectre GCR 3.0. I have my modem hooked up to the MODEM port on my computer, and to my surprise, when I logged on to America On Line, it worked like a champ. BTW, I understand regular ST and STe computers do not have a MODEM port, only a SERIAL port, and I'm told this also works well using Spectre GCR. After I got logged onto Mercury Center (and AOL), I immediately cancelled my subscription to GEnie - the "official" Atari service. I found GEnie to be very confusing to use, and not useful. And their Atari support is getting less and less, for obvious reasons. As much as I hate to admit it, Dave Small's Spectre GCR has really extended the useful life of my Atari, because AOL won't work on an Atari. I grudgingly compliment Small because his customer support is non-existent, and his bulletin board on GEnie is so out of date it's not even worth reading. --Mark van Wyk

Here in France, you can buy some accelerators for the Falcon. I just saw
the price of two of them yesterday. One is 980 FF, which is nearly 200$, but taken into
account the ratio between US prices and their equivalent in France, it would be 100$....
For this price, you get a 40MHz 030, and, but I'm not 100% sure, a 18MHz bus (instead of
16MHz), and many switch allowing to change the speed from the normal one to the fastest.
These accelerators are made in Germany. The retailer told it was very hard to install
(instal-
ling price not included !)

HI!

I am in need of a decent FAX program for my Atari STe (4megs ram),
I have a ZOOM 14.4 fax-modem. I have found a couple of fax programs
out there on the net, but most are in German and not much help for me.

So if someone can tell me where I can find a good English fax-modem program
for the ST or the file name it should be, I would really apprecaite it.
Something in the shareware/freeware catagory I would prefer, but I am
prepared to purchase somethign if it is highly recommened as well
Thanks for your help!

Please EMail responses as I cant usually keep up with net news!

Kev

I tried installing this game (boomprev.zip or something), and it sounds pretty cool, but when I try to run it, even with NOTHING installed, it says "Not enough memory". This is with 3.5 megs available or something. Do you really need a 14meg machine to run it?

3424. Falcon Hard Disk Recording

Newsgroup: comp.sys.atari.st
Date: 1994-09-07 16:47:20 UTC
From: pl4266@u.cc.utah.edu
Message-ID: <34kqqo$hr3@u.cc.utah.edu>
Source record: 180967

Hello!
First I would like to thank everyone who outlined the Falcon specs for me, I really found it extremely valuable. I want to do HD recording with the Falcon. I found one I can buy, after all the advice. I still have one problem. I went to look at the falcon expecting to see two sets of RCA jacks for stereo audio in and stereo out. I saw instead a 1/8" mini-jack that had a microphone symbol. Another with a headphone symbol and a "DSP" port. I went to our local music dealer to see if he had Cubase audio available for Atari. The man jumped up and down in circles screaming and waving his hands clearing atleast 3 feet and shouted a mocking song and dance about Atari fans who think they can do multi-track disk recording and sequencing without special sampling hardware (Yamaha CBX) on their Falcon. He swore to God and back that the Atari would be the wrong tool for the job and insisted I buy an A/V (or Power) Mac or a PC and also buy a $3000 DSP I/O processor (Yamaha CBX). So, I'm asking soberly for help in my final decision...
- Is the falcon's audio input MONO?
- What is the Impedence of the audio ports?
- What do I plug into the DSP port?
- How many Tracks can I hear at once with CUBASE AUDIO?
- Do I really need to buy a $3000 DSP/ SCSI processor to do professional quality recording with a FALCON ?
- Is the 68030 processor dast enough to handle 16 bit stereo Playback and Stereo Recording ?

I know many Atari users swear by the viability of the computer as a legitimate platform, this is your chance to prove to me that this computer means business! It is time to prove that the Atari really is a powerful professional recording tool or that the HD Recording claim is just a buzword and about as useful as a dictaphone. I am as loyal as this computer proves it can meet my needs. I'm not trying to attack Atari as a platform, actually I'd really like to believe it is as good as it sounds, if it is for real.
Thanks Again,
Paul Luscher

P.S. Where can I get CUBASE AUDIO...Address? Phone number?

Paul.Luscher@m.cc.utah.edu

>I have a 4 meg STFM, TOS 1.2 and Megafile 44.

Well, I used to run MacTCP with SLIP. The most important thing I remember is
that you must set the emulator to a Mac 512K. It will not work as a Mac Plus.

Other than that, I don't remember much. It was over a year ago that I set
this up, with lots of help from a Mac guru.

I did try PPP with MacTCP, but I have not gotten that to work yet. It might
possibly be a system 7 only MacTCP module.

>
Yes. You may also have to add a few resistors, depending on exactly when your
ST was made (sometimes they were fitted, sometimes not). You should be able to
identify these fairly easily, as there will be an identical set connected to the
existing chips.

> Is it feasible to suck the solder out of those holes and put chips in there?

I assume from your description that you have a motherboard designed for through
hole RAM chips, in which case there should be no problem. I recommend that you use
desoldering braid, rather than a solder sucker - my experience with solder suckers
is that they tend to suck up the PCB track as well as the solder. Place the end of
the braid on the hole, place the soldering iron tip on top, allow to heat up for a
few seconds, gently rotate the braid under the tip (don't apply too much pressure
on the soldering iron, otherwise you may damage the PCB track), and the hole should
clear. You may need to do this from both sides of the board. The main thing is to
take your time, but never spend too long on one hole - the tracks will lift up from
the PCB if you get them too hot. If you can find an old circuit board to practise
on first, so much the better.

An alternative, and quicker, solution is to get a 512k x 8 SIMM and wire this to
the PCB (using short wires). You can then stick the SIMM to the PCB using double
sided sticky tape, glue, or whatever else you like.

If your motherboard is designed for surface mount components then forget fitting
individual chips - the SIMM option is the one to go for.

> Are there any other steps, or will the machine recognize the additional
> 512k automagically if I do this?
>
That's it. If you have any more queries, please feel free to mail me.

Martin

P.S. Try to borrow a temperature controlled soldering iron with a reasonably fine tip - it will greatly increase the chances of success!

I am not sure about the Sun1 (if it existed), but I remember reading about
a 68000 system which used 2 68000 running in parallell in order to do
virtual memory. When the "real" processor bus-error'ed, they used the other
one to get the necessary status information in order to restart the 1st one
after doing the appropriate swapping :)

What about an old version of Adobe Type Manager (for the PC). Won't that
have the full set of PS fonts? I'm sure that second-hand or bin-ends can
be got for little, especially given the extensive bundling of ATM with
many packages.

John.

John> other ways to implement the environment required for Unix that might be
John> overlooked?

Virtual memory doesn't require a MMU. It does require the ability to trap
an illegal memory access and to restart the processor *in the same state* as
before the trap. The 68000 doesn't have that ability; the 68010 and all latter
680x0s have it.

Greetings,

Jens.

PLUS a little show with products from ATARI'S past, present
(and future ?).
PLUS Jaguar, perhaps as the output-module of the
newest ATARI-Computer? :-]

---> what can we expect?

Our main objective is to show what's possible with Atari computers
these days and in future. We want to provide informations to users,
developers and dealers in order to help them in their decision to
keep up their support for and use of Atari computers.

We want to offer a crossing border - chance for the "Atari-world"
to meet, get new contacts, test, sell, and buy products, spread
the latest gossip and so on.

Visitors will have the chance to buy and/or order stuff on the show
(depending on the attending companies).

This worked quite well last year - this year we have about
1000 squaremeters in a Fachhochschule (something like a little
university) and hopefully a bit more publicity.

---> who's doing it?

A K A (Anwender Kreis Atari) Freiburg

The AKA is a collection of professional (most of them) Atari users
who meet on a regular basis since 1985, now included Atari-System-
Dealer and Atari-System-Service we trust in !

We don't want to earn money with this. We would be very happy to get
our expenses in, though :-)

Please remember we're doing this cause Atari-User needs competend
partners and a secure base

---> responsibility?

Werner Laass
Neumattenstr. 12 D-79102 Freiburg
Tel + Fax: +49-761-34483
email: werner_laass@traveller.fido.de

* We show products, absolute new , like last year.

* Like last year, we show nearly the whole range of uses of
ATARI Computers, scienze, industry, business and hobby too.

* Professional users, most of them do their job on ATARI, have
invited soft- and hardwarehouses they trust in!

PRESS from different countries is present, like ATARI-Magazine France,
ATARI inside Germany, START MICRO France, Voci di Corridoio Italy,
RSC France and others . . .

Do you want to know about our success last year?
Look ATARI Magazine France, Jan 1994, a five-pages-report!

By the show 1993, the AKA Freiburg becomes a mediator for developers
and users cross over the borders.
This bonus we want to offer to the future of ATARI.

*** And ATARI will have a future, come and see ! ***

> this type of problem.

While I agree that the "default" way of ascertaining free space on secondary storage is quite slow on STs (what is this, a GEMDOS call or something?), I have seen several programs that can do it extremely quickly (the "Free Space" PD CPX module is one, for example). However, I would even be willing to wait for the "default" method in many cases (for example, when copying lots of files to lots of floppies, where they are just being used to carry the stuff somewhere). Making it a selectable option would do the trick, IMHO, with the default being "off". It would seem to me that this feature would be quite trivial to add, given the current selection of Neodesk routines.

> > Oh, what the hell. How about caching the floppy FATs to speed up floppy

>
> That type of feature isn't in there so that you CAN run external programs
> like you describe. ;-)

This one flew over my head. What does write-through caching of the floppy FATs have to do with external program execution? I meant only when using Neodesk's file processing functions, not system-wide caching, BTW. Do you mean other floppy caching software? Even if another caching program was used, it would just double-cache the stuff, which would be a bit silly but not affect performance adversely (it might make it worse in the "few milisecond" range, but who cares?). Also, making it selectable via "set preferences" would cure this.

> > Hey, as far as I'm concerned, anything y'all do to improve upon Neo 3.x

>
> Thanks, we appreciate it!

Write a Neodesk lookalike that replaces Microsoft Program/File Mangler
and the world would be a happier place. Heck, Chicago looks like it won't
be here until '96, and they'll probably screw it up too. Norton Desktop
is making a killing, it is far from Neodesk in terms of "sensible GUI" IMHO.

If I've understood correctly (my uncomfortable experiences do back this up) TOS has this 4k barrier on NEWDESK.INF file. I experienced computer crashing and odd behaviour as my newdesk file grow over 4k. Is there any patch that could fix this? You really can include far too few stuff in that 4k. I think I would laugh to this if I were a PC-user, at the moment it isn't very funny. I have Falcon with 4 megs of memory.

I saw an AUTO folder program that fixes it, but you must be running WINX. I don't remember the name, but it should be in umich under tosfixes or tos206 (sorry, I don't remember the actual directory names either :-). If you find a fix that works without WINX, let me know; I'd like to have something like that too.

Source record: 180975
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

>>What is the "piggyback" memory upgrade that I have heard mentioned previousl

A piggyback memory upgrade was popular on original ST and STM machines
(before STFMs came out). It involves piggybacking the second 16 chips on
top of the first 16! Most of the pins are just soldered together, but some
of the address ones are bent out and snipped. Onto the end of these pins
are soldered lengths of wire that then go back to the mother board.

Definately not for the faint hearted, and not to be advised nowadays.

:-)

Roland.

3441. Printer & ST Problems! Help! Anybody use an OKI Microline printer with an ST?

Newsgroup: comp.sys.atari.st
Date: 1994-09-07 23:05:25 UTC
From: s.bennett@uea.ac.uk
Message-ID: <s.bennett.92.037A61AD@uea.ac.uk>
Source record: 180976

I just got an OKI Microline 193 printer and am having some problems setting it up for my ST. I have the drivers & the printer worked on an IBMPC. No amount of fiddling with the dipswitches seems to help. I haven't used a printer on my ST before, so could that be the problem?
Any advice would be helpful

To all looking for GEM SPOOL 3.2:

I found out there are two? programs:
One is called GEM SPOOL, is shareware and at version 2.2.
The other is called GEM Spooler. This one is commercialand at
version 3.1 (or 3.2?).

I suppose they are different programs.

Hope thissolves the problem,

>I did state that you strip the keyboard down, I have been fixing
>Electronic stuff for some 40 years, and sill doing it...

Yes - but people who might follow you advice have been doing it for considerbly less - or not at all, and their interpretation of 'stripping' the keyboard, may not be quite what you meant.

:-)

Roland.

3445. megafile30 problem/question

Newsgroup: comp.sys.atari.st
Date: 1994-09-08 00:04:27 UTC
From: nicole@seas.smu.edu
Message-ID: <1994Sep8.000427.5538@seas.smu.edu>
Source record: 180931

When I first boot up, all seems fine, but shortly thereafter:
"Data on the disk in Drive C: may be damaged. Cancel Retry"

I recently purchased this used megafile 30, my first harddrive, so
I'm a real novice at hard drive problems. (Recently actually means
over a month ago, with no problem until now.

Many thanks for your suggestions as to how to diagnose this
aggravation.

John Trimble
nicole@seas.smu.edu

P.S.
I'm pretty handy with a soldering iron and multimeter,
so if you think it's a hardware problem like a power supply diode or
such, don't be afraid to say so. I fixed the power supply on my
monitor already, so I'm not afraid to open cases and test there. I
just wanted wise opinions first.

3446. NEC CD-ROM drives ...

Newsgroup: comp.sys.atari.st
Date: 1994-09-08 00:07:05 UTC
From: mbaffoni@skat.usc.edu
Message-ID: <34lkj9$ec5@skat.usc.edu>

I am in the market to buy a CD-ROM drive and I was wondering if anyone has experienced any trouble using the NEC 2x or the newer 3x (4x?) drives with the atari. I have a TT with MTOS 1.11. I assume I should use the CDROM.xfs.

Get out a 1st class text editor (STeno works flawlessly) and edit
out every bit of redundant information that you can--taking the whole
line that installed programs since removed, or moved, or changed, icons,
etc. If done carefully (keep a backup!) you should solve your problem
handily--reworking your desktop never dletes information from this file,
it just makes it bigger.

Good luck!

Actually, the program you're looking for is called GEMRAM (VRAM or
ROMSPEED are alternatives to GEMRAM, but GEMRAM is both PD and very
reliable). Any of those programs will copy GEM into RAM so that
you can apply patches to it (GEM, that is). Once that is loaded
(put it in the /AUTO/ folder first, obviously), you have ARROWFIX
(fixes and enhances GEM window scrolling for TOSes 1.04 and up),
WINX (cleans up and optimises many GEM window functions, allows up
to 40 windows to be open simultaneously, and more), and SHBUF (the
program you're after) (fixes the NEWDESK.INF buffer that TOS sets
to a fixed 4kb, which, since TOS 3.0, is not enough - this results
in weird computer behaviour as NEWDESK overwrites essential TOS
variables. SHBUF enlarges the NEWDESK buffer to 32kb.)

Unfortunately, this takes memory (unless you're willing to run the
above programs, save an IMG of GEM, and have new ROMs blown, which
as far as I know is illegal).
